

# TypoG – Typographic Fine-Tuning

Ch. L. Spiel\*

v0.1     2024/03/16

## Abstract

Package typog provides macros and environments for (micro-)typographic enhancements. It also supplies some means to avoid common typographic problems as, for example, orphan or widow lines. Moreover it supplies a high-level front-end of package microtype.

This package is copyright © 2024 Ch. L. Spiel. It may be distributed and/or modified under the conditions of the L<sup>A</sup>T<sub>E</sub>X Project Public License, either version 1.3c of this license or (at your option) any later version. This work has the LPPL maintenance status »author-maintained«.

# 1 Introduction

»Good typography« is the minimum acceptable solution;  
 »fine typography« is what we aspire to.  
 — Ilene Strizver

L<sup>A</sup>T<sub>E</sub>X is the start of good typesetting not the end. This package provides some tools for even better looking documents. When applied correctly its effects appear subtle and inconspicuous.

## 1.1 Overview

Package typog focuses on (micro-)typographic improvements.

The first section (Sec. 3.1) tends to the wish for more information in the typesetting process whether during the draft phase or in the final printed manuscript. The second part, Sec. 3.2, expands the hyphenation facilities of L<sup>A</sup>T<sub>E</sub>X. The third part, Secs. 3.3 to 3.6, deals with positioning glyphs in a more pleasant way. The fourth part discusses dearly missed macros for better control of the last line of a paragraph (Secs. 3.7 and 3.8). Part five covers the manipulation of the length of a paragraph: spacing (Sec. 3.9), font tracking (Sec. 3.10.1), and font expansion (Sec. 3.10.2). In the sixth part we address some shortcomings of spacing control, in particular a replacement for the macro `\sloppy` (Sec. 3.11). Section 3.12 presents special functions to avoid club or widow lines in a paragraph. As a simple extension of displayed mathematical equations we define a breakable variant in the seventh part (Sec. 3.13).

In the last part, Sec. 3.14, we introduce a novel way of generating ragged paragraphs, which still is very experimental.

## 1.2 Prerequisites

Package typog requires  $\epsilon$ -T<sub>E</sub>X; it relies on the L<sup>A</sup>T<sub>E</sub>X3 interface. Parts of it are based on package microtype. However, if the respective functionality is not used, typog can be applied without microtype.

The package was only tested with pdfT<sub>E</sub>X 3.14159265-2.6-1.40.21 from the TeX Live distribution of 2020 as shipped by Debian.

Throughout the whole document we indicate actual uses of the package's features in the margin. All these notes are examples themselves as they are typeset with `slightlyloppy`, and `smooth-raggedrightpar`. The title page has already demonstrated the effect of `lastlinecentered-par` in justified paragraphs in the abstract and the copyright notice.

## 2 Package Options/Configuration

Package `typog` does not override any existing macros or environments when loaded, unless explicitly told by a package option.

```
\usepackage[...]{microtype} % Only required for macros and
                             % environments in Secs. 3.10.1 and 3.10.2.

\usepackage[⟨OPTION⟩...]{typog}
```

### Package ⟨*OPTIONS*⟩/Configuration ⟨*key*⟩s

The package ⟨*OPTIONS*⟩ serve as configuration ⟨*key*⟩s, too. This means they can be set with `\typogsetup` and their values can be retrieved with `\typogget`. Options that rely on package `microtype` are indicated with »microtype req.«.

#### **breakpenalty=⟨*penalty*⟩**

Penalty for a line break at various points. Default value: 50; initialized by the current `\exhyphenpenalty`: 50).

#### **debug**

Write package-specific debug information to log file. Opposite: `nodebug`. Default: false.

#### **ligaturekern=⟨*dim*⟩**

Set ⟨*dim*⟩ of the kern that is inserted to split a ligature. See Sec. 3.3. Default value:  $\frac{33}{1000}$  em.

#### **mathitalicscorrection=⟨*dim*⟩**

Italics correction in math mode. See Sec. 3.4 and also the complementary configuration option `textitalicscorrection`. Default value:  $0.4\mu$ .<sup>1</sup>

#### **raise\*=⟨*dim*⟩**

Set the length by which selected characters (dash, hyphen, times, and number dash) are raised. Default value: 0pt.

Only the raise amounts for guillemets are unaffected by this option.

#### **raisecapitaldash=⟨*dim*⟩**

Set the length that the `\textendash` is raised in `\capitaldash`. See Sec. 3.6.2. Default value: 0.0pt.

#### **raisecapitalhyphen=⟨*dim*⟩**

Set the length that the hyphen character `⁀` is raised in `\capitalhyphen`. See Sec. 3.6.1. Default value: 0.0pt.

This sub-section is typeset with all `typog` parameters reset to their defaults by wrapping it in a `\typogsetup` environment with an empty argument.

We access the configuration values with `\typogget`.

This description list is protected against breaking items across pages within the first three lines by `\vtietop`.

<sup>1</sup> Note:  $1\mu$  is  $\frac{1}{18}$  em of the math font's em.

**raisecapitaltimes**= $\langle dim \rangle$ 

Set the length that the multiplication symbol  $\times$  is raised in `\capitaltimes`. See Sec. 3.6.4. Default value: 0.0pt.

**raisecapitalguillemets**= $\langle dim \rangle$ 

Set the length that single and double guillemets are raised in the uppercase versions of the guillemet macros. See Sec. 3.6.5. Default value: 0.0pt.

**raiseguillemets**= $\langle dim \rangle$ 

Set the length that single and double guillemets are raised in the lowercase versions of the guillemet macros. See Sec. 3.6.5. Default value: 0.0pt.

**raisefiguredash**= $\langle dim \rangle$ 

Set the length that the `\textendash` is raised in `\figuredash`. See Sec. 3.6.3. Default value: 0.0pt.

**shrinklimits**={ $\langle limit-1 \rangle$ ,  $\langle limit-2 \rangle$ ,  $\langle limit-3 \rangle$ } microtype req.**stretchlimits**={ $\langle limit-1 \rangle$ ,  $\langle limit-2 \rangle$ ,  $\langle limit-3 \rangle$ } microtype req.

Set the three limits, given in  $\frac{1}{1000}$  em, of shrinkability and stretchability for the respective levels. They are used in `setfontshrink` (shrinklimits triple only), `setfontstretch` (stretchlimits triple only), and `setfontexpand` (both triples of limits). See Sec. 3.10.2.

New  $\langle limit-\# \rangle$  values replace old ones. If one or more limits of the triple should remain unchanged pass a  $\star$  instead of a number.

Defaults for shrinklimits are 5, 10, 20 and those for stretchlimits are 5, 10, 20.

Both options can be used when loading the package and in the document preamble, but *not* in the document body.

**slashkern**= $\langle dim \rangle$ 

Set the size of the kerns before and after `\kernedslash`. See Sec. 3.5.1. Default value:  $\frac{50}{1000}$  em.

**textitalicscorrection**= $\langle dim \rangle$ 

Italics correction fallback-value; used if `\fontdimen1` is zero. See Sec. 3.4 on manual italic correction and also the complementary configuration option `mathitalicscorrection`. Default value:  $\frac{20}{1000}$  em.

**trackingttspacing**={ $\langle outer-spacing \rangle$ } microtype req.

Set the outer spacing of all typewriter fonts if used in environment `set-tracking` as described in Sec. 3.10.1.

The argument  $\langle outer-spacing \rangle$  gets passed to microtype's `\SetTracking` option `outer spacing` [17, Sec. 5.3]. If it contains commas, enclose the whole argument in curly braces. Default argument value: 300, 90, 60.

The option can be used when loading the package and in the document preamble, but *not* in the document body.

By default this option is unset.

### 3 Macros and Environments

Easy things should be easy, and  
hard things should be possible.  
— Larry Wall

This is the »User Manual« section of the documentation, where we describe all user-relevant macros and environments that are defined in package typog.

We follow the naming convention that every environment whose name ends with `...par` issues a `\par` at its end. Environments with different name suffixes never close with `\par`.

`typogsetup`

Configure the package with the given *<keys>*. An empty argument of `typogsetup` resets all *<keys>* to their default values.

```
typogsetup{<keys>}
```

The package can be (re-)configured at any point with `\typogsetup{<keys>}`, or – for localized changes – as

```
\begin{typogsetup}{<keys>}
...
\end{typogsetup}
```

where *<keys>* have the same format as the package options described in Sec. 2.

#### Use Cases

`\typogsetup` can substitute configuring the package at load-time or serve as an addition. ¶ Using the `typogsetup` environment allows to fine-tune the parameters for a specific use, e. g., display-sized text. ¶ It even is conceivable that a well-established typog-configuration gets attached to font-changing macros like `\rm`, `\sf`, etc. ■

`\typogget`

Sometimes the user needs to access internal configuration values of package typog. This can be done in a safe way without resorting to `\makeatletter`/`\makeatother`-bracketed code with the help of the following macro.

```
\typogget{<key>}
```

Retrieve the configuration value that is associated with *<key>*. For a list of available *<key>*s see Sec. 2.

#### Use Case

Raise glyphs by the same amount as configured with typog.

```
\newcommand*{\seesubst}
{\raisebox{\typogget{raisecapitalguillemets}}%
{\rightarrowhead}}
\renewcommand*{\labelitemi}
{\raisebox{\typogget{raisecapitaldash}}{\cdot}}
```

The latter only is useful inside of an `itemize` environment of course. ■

### 3.1 Information

The em-dash at the end of the quote is height-adjusted with `\cap-ital emdash*`.

Never forget: The visual output counts; it must always be checked, [...].  
— Udo Wermuth [23]

We define some functions for introspection of the typesetting process.

#### 3.1.1 Font Information

`\fontsizeinfo`

Capture the font size<sup>2</sup> and line spacing<sup>3</sup> at the point where `\fontsizeinfo` is called in macro  $\langle cs-name \rangle$ . Both dimensions are measured in points (pt) and the results are rounded to tenths.

```
\fontsizeinfo{ $\langle cs-name \rangle$ }
```

The call to `\fontsizeinfo` introduces a pair of macros to access the stored values. The unstarred version  $\langle cs-name \rangle$  expands to the lengths including their units (i. e., pt), the starred version  $\langle cs-name \rangle^*$  omits the units. The separating slash is `\kernedslash`, which is introduced in Sec. 3.5.1.

##### Use Cases

Colophon. ¶ Font test pages. ■

#### 3.1.2 Paragraph- and Page-Breaking Trace

`typoginspect`  
`typoginspectpar`

The environments `typoginspect` and `typoginspectpar` turn on the tracing of paragraphs and pages; optionally they display the parbox' contents. These environments can assist the user in identifying typographic problems in a quantitative way without getting distracted by unrelated information in the trace or the *log*-file.

```
typoginspect[ $\langle option \rangle$ ]{ $\langle id \rangle$ }  
typoginspectpar[ $\langle option \rangle$ ]{ $\langle id \rangle$ }
```

The  $\langle id \rangle$  is an arbitrary string that identifies the results in the *log*-file. If the mandatory argument is empty, `typog` constructs a unique value.

- 2 We use `\fontdimen6`, the em-height as the font size.
- 3 The line spacing simply is `\baselineskip`.

**Option****tracingboxes**[=*size*]

Specify the maximum box breadth and box depth reported in the log. If *size* is omitted the maximum values are assumed; this is similar to the `\tracingboxes` macro [1, p. 312].

**Caution**

The end-of-trace marker sometimes gets placed too early and the trace seems truncated. L<sup>A</sup>T<sub>E</sub>X reliably logs the requested trace information, but the write operations for trace data and `\immediate\write` which is used to print the end-tag are not synchronized. ■

**L<sup>A</sup>T<sub>E</sub>X log-file and trace.** The trace data in the *log*-file is bracketed by XML-tags.

```
<typog-inspect_id="⟨id⟩" _job="⟨jobname⟩" _line="⟨line-number⟩" _page="⟨page-number⟩">
...
</typog-inspect>
```

where the *⟨id⟩* is the user-supplied, unique<sup>4</sup> identifier of the group, *⟨jobname⟩* is the value of `\jobname`, *⟨line-number⟩* records the `\inputlineno` of the `\begin` of the group, and *⟨page-number⟩* gets replaced with the current value of the page counter.

— Any text tool can be used to ferret out the tags. EMACS users will find (`occur <regex>`) to be useful.

— As long as the tags are not nested **sed** or **perl** extract the information gathered by `typoginspect`, for example:

```
sed -ne '/<typog-inspect_id="..."/,/#</typog-inspect>#p'
< jobname.log
```

or

```
perl -ne '$a=0 if /<\typog-inspect>/; \
print $_ if $a; \
$a=1 if /<typog-inspect_id="..."/' \
< jobname.log
```

— The companion program **typog-grep** is tailored to extract the information marked up by `typoginspect` and `typoginspectpar` even if the environments are nested.

We reproduce the complete manual page of **typog-grep** in Section 5.

<sup>4</sup> It has turned out advantageous to use unique *⟨id⟩*s. However, *⟨id⟩*s are *not required* to be distinct.

*Tips*

- It may be necessary to run whatever L<sup>A</sup>T<sub>E</sub>X engine with a larger log-file line length, to prevent wrapped lines. With short lines the wannabe XML opening tags can get wrapped and thus become unrecognizable to dumb post-processors. To avoid wrapped lines prepend

```
/usr/bin/env max_print_line=2147483647
```

to the command-line. The value  $2147483647 = 2^{31} - 1$  effectively disables all line wrapping by L<sup>A</sup>T<sub>E</sub>X.

As both **pdf<sub>l</sub>atex** and **lua<sub>l</sub>atex** support changing their configuration on a by-call basis with option `-cnf-line=⟨STRING⟩` an alternative to the above example is to add

```
-cnf-line=max_print_line=2147483647
```

to the respective command-line.

- If more trace information is needed just add `\tracing...` calls right after `\begin{typoginspect}` or `\begin{typoginspectpar}`. ■

**Investigating the badness of a paragraph.** It is generally unnecessary to determine the *exact* classification of a paragraph's badness [12, p. 97n], though the curious user can switch on logging of T<sub>E</sub>X's line-break information with `\tracingparagraphs=1`<sup>5</sup> or simply use the **typoginspect** environment and check the suffixes

```
@@⟨breakpoint-number⟩ line ⟨line-number⟩.⟨suffix⟩
```

of each line in the paragraph, where for `⟨suffix⟩` the following mapping holds [12, p. 99]:

$0 \mapsto$  very loose,  $1 \mapsto$  loose,  $2 \mapsto$  decent, and  $3 \mapsto$  tight.

*Example*

```
@@17: line 15.1- t=142289 s=93.58414 a=2.86073 -> @@16
```

1. The feasible breakpoint @@ number 17 in the paragraph leads to
2. line 15, which is the loose .1 last line of the paragraph.
3. Up to this breakpoint the paragraph has picked up total demerits t of 142289.
4. The following two values only show up if `\lastlinefit ≠ 0`:
  - (a) The shortfall s and
  - (b) glue a or g.<sup>6</sup>

<sup>5</sup> Reference 22 provides an exceptionally detailed discussion of the output of `\tracingparagraphs`.

<sup>6</sup> The author is unaware of any descriptions of s, a, or g. The interested reader is referred to the source code, e.g., *pdf<sub>l</sub>tex.web*; search for `print("_s=")`. In the weaved documentation the first relevant section is §1851.

5. The best<sup>7</sup> way to get here, i. e., @17 is via `␣->` breakpoint `@␣` 16. ■

### Note

When package `microtype`'s font expansion feature jumps in the reports on »Loose `\hbox (badness ...)`« and »Tight `\hbox (badness ...)`« contain the amount of shrinking or expansion as parenthesized values (units are thousands of the current font's em) like, e. g.,

```
\T1/erewhon-LF/m/n/9/@/@ (-13) ...
```

or

```
\T1/erewhon-LF/m/n/9/@/@/10ls (+7) ...
```

An `ls` appended to the font name specification indicates that `microtype`'s letter spacing feature is active and changed the tracking by that many thousands on an em as indicated before `ls`. ■

**Investigating page-breaks.** Use `\tracingpages=1` or the `typoginspect` environment to switch on tracing of  $\TeX$ 's page-break information [12, p. 112n].<sup>8</sup>

The first time vertical material enters a new page,  $\TeX$  logs

```
%% goal height=<text-height>, max depth=<max-depth>
```

where `<text-height>` is the total height  $\TeX$  wants to achieve and `<max-depth>` is the maximum depth of the `\hbox` in the last line of the page is allowed to have without considering `<text-height>` to be exceeded. For example:

```
%% goal height=598.0, max depth=5.0
```

For every vertical breakpoint  $\TeX$  records

```
% t=<total-height> g=<goal-height> b=<badness> p=<penalty>
    c=<cost>
```

Here, `<total-height>` and `<goal-height>` are the current total height of the page and the current goal height to achieve with respect to this vertical breakpoint.

The value of `<penalty>` and `<cost>` can be infinite, which would be indicated with an asterisk `*` instead of a numerical value. The best vertical breakpoint found so far on the current page is indicated by a trailing sharp-sign `#`.

### Example

```
% t=351.3 plus 11.0 minus 1.0 g=553.9 b=10000 p=-300 c=100000#
```

1. At this vertical breakpoint the total page height `t` is 351.3 pt. We have picked up glue with 11 pt stretchability and 1 pt shrinkability along the way.

<sup>7</sup> »Best« means the minimum-demerits path in the graph of the feasible breakpoints, which has been constructed for the paragraph.

<sup>8</sup> See also the discussion of the  $\TeX$  output routines by SOLOMON [19].

2. The current goal height  $\bar{g}$  is 553.9 pt. If the initial goal height was 598 pt we can deduce that some space for other vertical material was subtracted.
3. The badness  $\bar{b}$  of this vertical break is horrendous which is expected for the first lines on a page since breaks so early are rightfully considered infinitely bad.
4. The penalty  $\bar{p}$  at this point actually is a bonus.
5. As the badness is 10000 the cost for a break is calculated to 100000. ■

### 3.2 Hyphenation

$\text{\TeX}$ 's and thus  $\text{\LaTeX}$ 's hyphenation algorithm is highly sophisticated, yet the document author sometimes lacks convenient macros to solve seemingly trivial typographic tasks. For example, to hyphenate a compound word connected by a hyphen.

`\allowhyphenation`

$\text{\TeX}$  inhibits breaks of the component words by default. The following macro rectifies the problem.

```
\allowhyphenation
```

Macro `\allowhyphenation` re-enables automatic hyphenation after  $\text{\TeX}$  has turned it off, for example, in the innocuous case of a hyphenated compound.

The admittedly simple rules when  $\text{\TeX}$  auto-hyphenates and when not give rise to so many different, yet interesting cases that we devote Tab. 1 to them. The seemingly special cases shown there are not that uncommon, e. g., consider `\spin-½` which is coded as `\mbox{spin-\textfrac{1}{2}}`. A line break between the text and the fraction would garble the term.

#### Use Cases

All examples from the bottom of Tab. 1 on p. 11. ¶

Fix line breaks of index-entries in a narrow index:

```
Halbgruppe, Transformations\allowhyphenation\mbox{-}\,---
```

The first part, `Transformations` is allowed to be hyphenated, but a break after the hyphen is prohibited as it results in a prowling em-dash at the beginning of the next line. ¶

Re-enable hyphenation when a macro decays into a `\hbox`:

```
Einselement\allowhyphenation\rlap{,}\footnote{...}
```

where `\rlap` is equivalent to something like `\makebox[0pt]{#1\hss}`. ¶

Use `\allowhyphenation` to turn on hyphenation of the first word of a paragraph as, e. g., in a narrow index or a `\marginpar`:

```
\marginpar{\allowhyphenation Kontakttransformationen}
```

A common trick to sweet-talk  $\text{\TeX}$  into hyphenating the first word of a paragraph is to put `\hskip0pt` in front of it. ■

TABLE 1:  $\text{\TeX}$  offers plenty of possibilities to hyphenate a compound. ¶ We use the sample ›hyphenated-compound‹ to show various code examples and the results that they produce. The parts are automatically hyphenated like this: ›hyphenated‹ → ›hy-phen-ated‹ and ›compound‹ → ›com-pound‹.

LaTeX-Code	Result	Note
hyphenated-compound	hyphenated-compound	Most frequently used code; the <code>hyphen</code> expands to <code>\discretionary{-}{-}{-}</code> rendering the parts un-breakable
hyphenated\mbox{-}% compound	hyphenated-compound	Suppress hyphenation with the <code>\mbox</code> in the compound
\mbox{hyphenated-% compound}	hyphenated-compound	Avoid line break and thus hyphenation
hyphenated\hyp compound	hy- phen- ated-  com- pound	Macro <code>\hyp</code> defined in package <code>hyphenat</code> [27]
hyphenated% \allowhyphenation-% compound	hy- phen- ated- compound	Macro <code>\allowhyphenation</code> of package <code>typog</code> ; only unblock hyphenation of the first part
hyphenated-% \allowhyphenation compound	hyphenated-com- pound	Macro <code>\allowhyphenation</code> of package <code>typog</code> ; only unblock hyphenation of the second part
hyphenated% \allowhyphenation \mbox{-}% compound	hy- phen- ated-compound	Macro <code>\allowhyphenation</code> of package <code>typog</code> ; hyphenate first part and keep the original <code>hyphen</code> unbreakable
hyphenated% \allowhyphenation-% \allowhyphenation compound	hy- phen- ated- com- pound	Macro <code>\allowhyphenation</code> of package <code>typog</code> ; hyphenate both parts, similar to <code>\hyp</code> shown above

Whenever using `\-`, the short-hand form of `\discretionary{-}{}{}`, authors writing in a foreign language should reconsider whether it really beats `\hyphenation` or `\babelhyphenation`<sup>9</sup>. in the particular situation. However, sometimes `\-` actually *is* the way to go.

Let us assume we mark up proper names with

```
\DeclareRobustCommand*{\propername}[1]
{\mbox{\textsc{#1}}}
```

and we want to have hyphenatable »ABELsche Gruppe« or »EUKLIDischer Vektorraum« without dropping the markup. To that end we define commands that insert a hyphenation point at the right place:

```
\newcommand*{\abelsche}
{\propername{Abel}\-sche}
\newcommand*{\euklidischer}
{\propername{Euklid}i\-scher}
```

which are impossible to encode with `\hyphenation` or `\babelhyphenation` as these expect only letters and dashes as their arguments with spaces separating the words.

### Tip — Typewriter Fonts

Sometimes it is desired to get a hyphenatable typewriter font. L<sup>A</sup>T<sub>E</sub>X suppresses any hyphenation for fonts in `\ttfamily` by un-defining their `\hyphenchars`. If these are reassigned, the usual hyphenation occurs again.

So, a fictitious macro ‘`\code`’ to typeset code sequences could look like this:

```
\newcommand*{\code}[1]
{{\ttfamily
\hyphenchar\font='-\relax #1}} ■
```

`\breakpoint`

The empty discretionary construct [12, p. 95], `\discretionary{}{}{}`, is so helpful that it deserves its own macro.

```
\breakpoint*
\breakpoint
```

The starred form inserts an empty discretionary, which disables automatic hyphenation. The unstarred form inserts an empty discretionary and immediately re-enables automatic hyphenation.

The difference between `\breakpoint` and the L<sup>A</sup>T<sub>E</sub>X macro `\allowbreak` is not only that the former has a starred form, but the penalty associated with `\breakpoint` is the current<sup>10</sup> `\exhyphenpenalty`, whereas `\allowbreak` statically assigns a zero penalty.

<sup>9</sup> `\babelhyphenation` is the multi-lingual extension of T<sub>E</sub>X’s `\hyphenation` and it is defined in package `babel` [5]

<sup>10</sup> At this point in the document `\exhyphenpenalty=50` holds.

*Use Case*

Prefixes that end in a hyphen inside of a pair of parenthesis:

```
\mbox{(pre-)}\breakpoint* \propername{Hilbert} space ■
```

**3.3 Disable/Break Ligatures**`\nolig*`

Break a ligature without introducing a hyphenation opportunity.

```
\nolig*[\langle kerning \rangle]
```

Inserting `\nolig*` disables a ligature at the given point by a kern. Set the size of the kern with `ligaturekern` or override this value with `\langle kerning \rangle` as thousandths of the current font's em.

*Use Cases*

`\nolig*` can be useful in headings, where additional hyphenation points are unwelcome. ¶ In fonts with an overly rich set of ligatures `\nolig*` offers a straightforward means to suppress unwanted ligatures at non-hyphenatable positions. ¶ Rectify the appearance of a pseudo ligature, i. e., two adjacent characters that look like a ligature, but actually are not. ■

`\nolig`

Break a ligature and introduce a hyphenation opportunity.

```
\nolig[\langle kerning \rangle]
```

Inserting `\nolig` disables a ligature at the given point as `\nolig*` does and introduces a hyphenation opportunity with penalty `breakpenalty`.

**Important — hyperref bookmarks**

If a `\nolig` – whether starred or un-starred – occurs in an argument that is processed with package `hyperref` for inclusion into the document's PDF-bookmarks an additional argument is necessary to parse the macro. This argument either is `\relax` or the empty group `{}`.

```
\nolig*[\langle kerning \rangle]\relax   \nolig[\langle kerning \rangle]\relax
\nolig*[\langle kerning \rangle]{ }   \nolig[\langle kerning \rangle]{ }
```

The prototypical places where this processing-for-PDF-bookmarks happens are the sectioning macros, e. g., `\chapter`, `\section`, `\subsection`, etc.

L<sup>A</sup>T<sub>E</sub>X will bail out with an error if the extra argument is not passed to `\nolig` in these situations.

Alternatively use `\texorpdfstring` [16, Sec. 4.1.2, p. 22]. ■

*Use Cases*

`\nolig` can be used with just about any ligature that needs to be split into its parts. ¶  
 It also has proven beneficial in separating pairs of characters that are kerned to tightly (e. g. the `\ij`, as in bijection, which is particularly distracting here, for it occurs at the boundary of two syllables). ■

**3.4 Manual Italic Correction**`\itcorr`

The italic correction offered by  $\TeX$  or  $\LaTeX$  sometimes needs a helping hand.

```
\itcorr*{\langle strength \rangle}
\itcorr{\langle strength \rangle}
```

In text mode macro `\itcorr` inserts a kern whose width is proportional to `\fontdim1`, which is the font's italic correction. If `\fontdim1` happens to be zero (e. g. for an upright font), `\itcorr` uses the value set with `textitalicscorrection` instead of `\fontdim1`. The starred version always uses `textitalicscorrection`. In math mode macro `\itcorr` uses the value set with `mathitalicscorrection`<sup>11</sup> in both the starred and the unstarred form.

Typical slant angles of serif italics fonts range from 8° to 18° and thus values for `textitalicscorrection` from .14 to .32. Note: `\langle strength \rangle` can be negative and fractional `\langle strength \rangle`s are allowed.

*Use Cases*

Stronger or weaker correction than `\/`. ¶ Correct a non-slanted or non-italicized font. ¶ Negative correction at the left-hand side<sup>12</sup> of italics, i. e., compensate »shift-to-the-right effect« of italics. ¶ Positive correction at the left-hand side of italics, e. g., an opening parenthesis or square bracket followed by an italic `f` (before: 8, after: 7) or `y` (before: 4, after: 1) reaching far to the left below the baseline. ■

**The `\langle strength \rangle` parameter explained.**  $\TeX$  records the slant angle  $\alpha$  of a font in `\fontdim1` as  $1\text{ pt} \times \sin \alpha$ . Rephrased the formula means: *How much horizontal space is required for a letter slanted with  $\alpha$  that is 1 pt high?* So, `\itcorr{\langle strength \rangle}` calculates

$$\langle strength \rangle \times 1\text{ pt} \times \sin \alpha.$$

A well-chosen `\langle strength \rangle` should be the absolute minimum value which avoids that the glyphs typeset in italics collide with other – usually non-italics – letters or symbols unless this disturbs the consistency of the overall tracking.

Correction of the right-hand side and  $\alpha > 0$ : A reasonable first guess of `\langle strength \rangle` is the highest point where the rightmost part of the letter would touch

<sup>11</sup> Separate adjustments may be desirable if the math font's italics have markedly different slants.

<sup>12</sup> Groff has the machinery for left-italic-correction. Its `font-metrics` files support per glyph left-italic-correction values and users can access them conveniently via `\,`.

a rule angled at  $\alpha$  with respect to the baseline. The correction of the left-hand side and  $\alpha > 0$  considers the lowest ›touching‹ point below the baseline on the left-hand side of the letter. Negative values of  $\alpha$  exchange the reference points.

Figure 1 shows how  $\langle strength \rangle$  and  $\alpha$  are related. Moreover, it demonstrates how intricate italics correction is.

FIGURE 1: Some letters of an italics font. We use the capital  $\text{H}$  to measure the angle  $\alpha$  between the plumb-line (drawn dashed) and a tangent to the rightmost parts of the glyph. The length of the plumb-line is proportional to  $\langle strength \rangle$  and the short, thick part of the baseline symbolizes the resulting italics correction. ¶ The middle example, the capital  $\text{L}$ , shares  $\alpha$  with  $\text{H}$  but obviously needs a far smaller  $\langle strength \rangle$  or even no correction at all. ¶ The  $\text{a}$  at the right-hand side is an example of why  $\text{T}_{\text{E}}\text{X}$  allows to assign an italic correction to each individual character of a font. Not only features the lowercase  $\text{a}$  a larger  $\alpha$  – despite being a member of the same font – but its serif adds as much to the width as the slanted stem.

We center the last lines of each figure and table caption with the help of `lastline-centeredpar`.

### 3.5 Apply Extra Kerning

Package `typog` supplies two sets of macros to kern some of the punctuation symbols. One is for forward slashes the other, more extensive one, for hyphens.

#### 3.5.1 Slash

`\kernedslash`

Macro `\kernedslash` expands to a forward slash (`/`) with some extra space around it.

```
\kernedslash*
\kernedslash
```

The starred form is unbreakable, the non-starred version introduces a break point with penalty `breakpenalty` after the slash. Configure the kerning around the slash with `slashkern`.

If the word following the slash should not be hyphenated append `\nobreak` after `\kernedslash*`.

*Use Cases*

`\kernedslash` improves the appearance of pairs of years typeset in lining numerals: `\year_1/\year_2`. ¶ The macro has proven helpful in many cases where the right hand side of the slash starts with a capital as, for example, `\city/\state-code` (US-specific) or `\anything/\noun` (any language that capitalizes `\noun`). ■

**3.5.2 Hyphen**

`\kernedhyphen*`  
`\kernedhyphen`

Macros `\kernedhyphen*` and `\kernedhyphen` expand to a hyphen (‐) with given kerning to its left and to its right.

```
\kernedhyphen*[\raise]{\left-kerning}{\right-kerning}
\kernedhyphen[\raise]{\left-kerning}{\right-kerning}
```

Typeset an unbreakable hyphen with `\kernedhyphen*` or a breakable hyphen (like `\hyp` of package `hyphenat` [27]) with `\kernedhyphen` and apply some kerning to left and to the right of it. The values `\left-kerning` and `\right-kerning` are multiplied with one thousandth of the current font's em to get the size of the kern.

The optional argument `\raise`, also given in  $\frac{1}{1000}$  em, allows to adjust the height of the hyphen similar to the macros described in Sec. 3.6. In text mode the special argument `\_*` for `\raise` transfers the current value of `\raisecapitalhyphen`. The default for `\raise` is zero.

We also define specialized versions for kerning on the left-hand side or the right-hand side only. These macros work like their two-argument counterparts and set the appropriate other kerning to zero.

```
\leftkernedhyphen*[\raise]{\left-kerning}
\leftkernedhyphen[\raise]{\left-kerning}
\rightkernedhyphen*[\raise]{\right-kerning}
\rightkernedhyphen[\raise]{\right-kerning}
```

*Use Cases*

Composites in the form `\math-\noun` in languages where nouns are capitalized. ¶ Composites where one or both sides of the hyphen are typeset in different fonts, like, `\small-caps-\roman`. ■

`\leftkernedhyphen*`  
`\leftkernedhyphen`  
`\rightkernedhyphen*`  
`\rightkernedhyphen`

### 3.6 Raise Selected Characters

#### Caution

The height adjustment disables a font's built-in kerning. ■

General note for all raised hyphen-like macros: Prefer the starred version if applied in front of any punctuation.

#### 3.6.1 Capital Hyphen

`\capitalhyphen`

In many fonts the height of the hyphen character `-` above the baseline is optimized for lowercase letters. In languages that capitalize their nouns as, e. g., German, this may be too low for compounds involving capitals.

```
\capitalhyphen*
\capitalhyphen
```

The unstarred version introduces a hyphenation opportunity right after the hyphen character (with penalty `breakpenalty`) whereas the starred version does not. The actual amount the hyphen gets raised in `\capitalhyphen` is determined by `raisecapitalhyphen`.

#### Use Cases

In languages that capitalize their nouns, the typical use-case is between an *⟨abbreviation⟩* and a *⟨noun⟩* when *⟨abbreviation⟩* is a string of uppercase letters. The same holds true for a connection of an uppercase variable in mathematical mode and a *⟨noun⟩* starting with a capital letter. ¶ Abbreviated compound first names (e. g., A.-M. Legendre) can be joined with the starred version. ¶ Also, the starred form is suited for ISO 8601-formatted dates if they are composed with lining-style numerals. ■

#### 3.6.2 Capital Dash

`\capitalendash`  
`\capitaldash`

The situation of the en-dash `-` is almost identical to the one of the hyphen character `-` described in the previous section or the number dash to be introduced in the next section.

```
\capitalendash*   \capitaldash* (alias)
\capitalendash    \capitaldash (alias)
```

The unstarred version introduces a hyphenation opportunity right after the dash (with penalty `breakpenalty`) whereas the starred version does not. The actual amount the hyphen gets raised in `\capitaldash` is determined by `raisecapitaldash`.

*Use Cases*

Letter ranges as used in the title of an index. ¶ Any mixed letter-digit ranges (of capital letters and lining-style numerals) as in e. g., Sec. B-2. ■

`\capitalemdash`

For completeness we also introduce a raised em-dash  $\text{—}^7$ . It behaves just like its en-dash sibling.

```
\capitalemdash*
\capitalemdash
```

*Use Cases*

Item symbols in itemized lists if the item text starts with an uppercase letter. ¶ Theorem headings, like, e. g., Definition 6.2 — Lie Algebra. ■

**3.6.3 Number Dash (Figure Dash)**

`\figuredash`

The en-dash often gets used as separator for numerical ranges. In most fonts it has the correct height above baseline for oldstyle numerals, e. g. 12–34–56–78, but with lining numerals – depending on the font – it may look like it suffers from »broken suspenders«: 12–34–56–78. The situation is similar to `\capitaldash` and `\capitalhyphen` discussed in Secs. 3.6.1 and 3.6.2.

`\figuredash` yields 12–34–56–78 for sans-serif and 12–34–56–78 for the roman typeface.

```
\figuredash*
\figuredash
```

The unstarred version introduces a hyphenation opportunity right after the en-dash with penalty `breakpenalty` whereas the starred version does not. The actual amount the en-dash gets raised in `\figuredash` is determined by `raisefiguredash`.

Values of .05em to .1em are typical for fonts that need this kind of correction and .1em is a good starting point. Table 2 summarizes some findings.

Other macros may be redefined with `\figuredash` for a consistent appearance of the copy, like, for example, `\citedash` (package `cite [3]`), or `\crefrangeconjunction` (package `cleveref [8]`).

*Use Case*

The key customers of `\figuredash` are the PAGES entries of bibliography databases. ¶ In an index generated with `makeindex` the range delimiter `delim_r` is a candidate for `\figuredash*`. ■

The [index](#) of this document uses `\figuredash*`, too.

TABLE 2: Suggested values for raising the en-dash between lining numerals of some selected fonts.

Raise em	Font Name
0	Alegreya, Arvo, Bitter, Clara, EB Garamond, Gentium, Ibarra Real Nova, INRIA Serif, Libertine, Libertinus, Merriweather, PT Serif, Roboto Slab, Spectral, STIX, and many more
.05	fbf, Source Serif Pro
.0667	Libre Baskerville, Crimson Pro, Erewhon, Droid Serif
.1	GFS Artemisia, Libre Caslon, Coelacanth, Crimson Pro, Crimson Text, T <sub>E</sub> X Gyre Pagella, Quattrocento, TX Fonts, ADF Venturis, and many more

### 3.6.4 Multiplication Sign – Times $\times$

`\capitaltimes`

The `\capitaltimes` macro is a variation of the `\capitalhyphen` theme.

```
\capitaltimes
```

In text mode it expands to an appropriately raised `\texttimes`, and in math mode to a raised `\times` binary operator, where `raisecapitaltimes` determines the amount of upward-shifting applied; it never inserts any break points.

#### *Use Case*

Prime use are two- or higher-dimensional shape specifications with lining numerals or uppercase letters in mathematical mode as, for example, matrix or tensor sizes. ■

### 3.6.5 Guillemets

Another possible typographic problem this package addresses is that both sets – single and double quotes – of guillemets may suffer from a too small distance to the baseline.

For the implementation typog relies on the T1<sup>13</sup> font encoding not on package babel.

<sup>13</sup> Font encoding T1 can be forced via `\usepackage[T1]{fontenc}` in the document preamble.

```
\singleguillemetleft
\singleguillemetright
\doubleguillemetleft
\doubleguillemetright
```

**Lowercase Versions.**

```
\singleguillemetleft  \singleguillemetright
\doubleguillemetleft  \doubleguillemetright
```

For consistency and easy accessibility we define height-adjusted left and right single guillemets as `\singleguillemetleft` and `\singleguillemetright`; double guillemets are available with `\doubleguillemetleft` and `\doubleguillemetright`. Their heights above the baseline are collectively adjusted with `raiseguillemets`.

```
\Singleguillemetleft
\Singleguillemetright
\Doubleguillemetleft
\Doubleguillemetright
```

**Uppercase Versions.**

```
\Singleguillemetleft  \Singleguillemetright
\Doubleguillemetleft  \Doubleguillemetright
```

The companion set of single, double, left, and right quotes corrected for uppercase letters or lining numerals is `\Singleguillemetleft` and `\Singleguillemetright` and `\Doubleguillemetleft` and `\doubleguillemetright`. Mnemonic: These macros start with an uppercase letter. Their height above the baseline is adjusted with `raisecapitalguillemets`. Values of .025em to .075em are typical for fonts that need this kind of correction. Table 3 summarizes some findings.

TABLE 3: Suggested values for raising guillemets of some selected fonts.

Raise		Font Name
Lowercase em	Uppercase em	
0	.05	EB Garamond, Libertinus, Merriweather, and many more
.025	.05	Gentium
.04	.0667	ADF Baskervald
.05	.0625	GFS Artemisia, GFS Didot

*Tip*

Define shorthand macros that simplify the application of guillemets, like, e. g.,

```
\newcommand*\{singlequotes}[1]
{
  \singleguillemetright #1%
  \singleguillemetleft}
\let\sq=singlequotes
```

and similar definitions for `\Singlequotes`, `\doublequotes`, and `\Doublequotes`.

Users working according to the French typesetting conventions will want to add extra spacing between the guillemets and the macro argument already in these macros. ■

Whether the guillemets must be height-adjusted for lowercase letters depends on the font. Careful judgment at various magnifications with a variety of samples is necessary.

**Interaction with package `csquotes`.** The users of package `csquotes` can hook up the guillemets as defined by typog with `\DeclareQuoteStyle`:

```
\DeclareQuoteStyle{typog-guillemets}
  {\doubleguillemetright}% opening outer mark
  {\doubleguillemetleft}% closing outer mark
  {\singleguillemetright}% opening inner mark
  {\singleguillemetleft}% closing inner mark
```

As always, the influence of package `babel` on `csquotes` has to be put into consideration. See Sec. 8 of the `csquotes` manual for a description of its configuration possibilities.

#### *Use Case*

All-capital words as for example acronyms put in guillemets that are raised somewhat almost always look better, whether using the French typographic convention (guillemets pointing outward plus some extra kerning) or the other way round (guillemets pointing inward). ■

#### *Anticipated Changes & Possible Extensions*

A correction in the other direction, i. e., lowering certain characters may also be desirable, to visually align them to the surrounding copy. Parentheses and in particular square brackets around all-lowercase text come into mind. ■

### 3.7 Align Last Line of a Paragraph

The usual algorithms of L<sup>A</sup>T<sub>E</sub>X typeset the last line of a paragraph flush with the left margin unless `center`, `raggedleft` or `Centering`, `FlushRight` (package `ragged2e` [18]) are in effect. For an instructive discussion consult Ch. 17, »Paragraph End«, of Ref. 9. The following environments allow to adjust the last lines of paragraphs in different ways.

The environment `lastlinerraggedleftpar` adjusts the various skips such that the last lines of the paragraphs gets typeset flush with the right margin.

```
lastlinerraggedleftpar
lastlineflushrightpar (alias)
```

`lastlinerraggedleftpar`  
`lastlineflushrightpar`

`lastlinecenteredpar`

The name `lastlineflushrightpar` is an alias for `lastlineragged-leftpar`.

Center the last lines of the paragraphs enclosed by this environment.<sup>14</sup>

```
lastlinecenteredpar
```

### Use Cases

`lastlineflushrightpar`: Narrow, justified parts of the text put flush against the right margin. ¶ `lastlinecenteredpar`: Table or figure captions typeset justified as centered boxes. ■

## 3.8 Fill Last Line of a Paragraph

The problem of when and how to fill the last line of a paragraph is quite intricate. We first define the problem then we proceed to general purpose functions and we close the section with specific environments to control the length of the last line.

### 3.8.1 Problem Definition

Depending on the value of `\parindent`, either zero or nonzero, there may be the desire to control the length of the last line of a paragraph.

1. `\parindent > 0` [25, O1]

If the last line of a paragraph is shorter than the `\parindent` of the following paragraph a visual gap tears open.

The same problem arises with displayed math in a flush-left<sup>15</sup> setting, e. g., `amsmath` [2] and option `fleqn`.<sup>16</sup>

A possible remedy is to reflow the paragraph in a way that its last line is clearly wider than `\parindent`; a typical suggestion being twice the `\parindent`.

<sup>14</sup> Also compare the approach taken in Ref. 25.

<sup>15</sup> The common practice of centering displayed equations does not call for the manipulations of a paragraph's last line discussed here.

<sup>16</sup> For displayed equations and `amsmath` the relevant parameter is `\mathindent`.

2. `\parindent = 0` [25, O2]

If the last line of a paragraph is completely filled with text, i. e., flush with the right margin, it may become hard to spot the start of the following paragraph unless `\parskip` is large.<sup>17</sup>

A possible, more legible solution is to reformat the paragraph in a way such that its last line leaves a marked gap with respect to the right margin.

The suggestions for the gap-width vary from two em to twice the width of a »typical« `\parindent`<sup>18</sup> for the gap [7].

**Tip**

In theory both problems, O1 and O2 can be resolved by either shortening or prolonging the last line of the paragraph. For the concrete case it is up to the user to decide which direction to go and to choose the method that yields the most pleasing typographic results.

$\text{\TeX}$  always considers the paragraph in its entirety. Thus any change the user demands »just for the last line« will permeate the whole paragraph and in unfortunate cases botch it.

Prudent users check the appearance of the problematic, original paragraph against one or more corrected versions of it – at least visually. Quantitative comparisons can be performed with the help of `\tracingparagraphs`. ■

**Important**

For the techniques in the following two subsections to work the paragraphs treated with them should have certain advantageous properties.

- Technically, the paragraphs need to contain enough glue (see e. g. Sec. 3.11) to achieve a low badness such that the desired paragraph end is deemed feasible by  $\text{\TeX}$ .
- Aesthetically, the paragraphs must be long enough to absorb the change in last-line fill level otherwise their gray-values visibly deviate from the average. ■

<sup>17</sup> Package `parskip` defines `\parskip` as 6pt plus 2pt for a base size of 10pt.

<sup>18</sup> For example,  $\text{\LaTeX}$ 's class `article` uses a `\parindent` of 25pt.

### 3.8.2 Manual Changes

Most [O1](#) or [O2](#) situations can be navigated with do-it-yourself methods. Here are some common recipes.

1. End-of-paragraph intervention.
    - (a) Tie `\tie`<sup>19</sup>  
Tie the last words.  
The problem with the tie may be a hyphenation of one of the words that participates in the tie. The next item avoids this disadvantage.
    - (b) `\mbox`  
Join the last words or inline equation at the end of the paragraph with an `\mbox`.
    - (c) `\linebreak`.<sup>19</sup>  
Add a `\linebreak` to the back part of the paragraph (approximately where the `\mbox` of item [1b](#) would start) in a way that the last line receives the desired length. In turn the next-to-last line may become unsightly. Counteract this degradation for example with recipes [2a](#) to [2c](#).
- Tying and `\mbox`ing lend themselves to generalizations. We need not only tie at end of a paragraph but fuse logical units of sentences or inline equations so that the relevant information literally stays in the reader's focus. Cementing together text of course finds an end when overfull lines start to show up.
2. Uniform paragraph change.
    - (a) Vary spacing.  
Modify the inter-word spacing, for example, with the macros introduced in Sec. [3.9.2](#).  
Enclose the paragraph in either `\loosespacing` or `\tightspacing`. Increase the spacing  $\langle level \rangle$  until the last line gets the desired length.
    - (b) Vary font tracking.  
Enclose the paragraph in a `\setfonttracking` group. See Sec. [3.10.1](#). Increase or decrease the tracking in steps of  $\frac{1}{1000}$  em until the last line looks ok.
    - (c) Vary font expansion.  
Enclose the paragraph in a `\setfontexpand` group. See Sec. [3.10.2](#).
  3. A combination of any of the above items.

<sup>19</sup> U. WERMUTH, personal communication, August 2, 2022.

## 4. Some curveballs.

- (a) If the paragraph already suffers from one of the problems that  $\text{\TeX}$  addresses with `\doublehyphendemerits`, `\finalhyphendemerits`, or `\adjdemerits`, crank up one or all of these values to 10000 and observe whether the length of last line changes in the desired direction.
- (b) If any influential microtype features have been enabled try with one more more of them *disabled*. See, e. g., environment `nofontexpansion` in Sec. 3.10.2.

## 3.8.3 Multi-Purpose Environments

`shortenpar`  
`prolongpar`

The two environments `shortenpar` and `prolongpar` can be employed in quite general situations when a paragraph should be typeset one line longer or shorter, e. g., to avoid a widow line<sup>20</sup> or a club line<sup>21</sup> [12, p. 104 and 14]. (See also Sec. 3.12 for special functions to avoid clubs or widows.) ›Accidentally‹, they also change the length of the last line of the paragraph.

`shortenpar`

Environment `shortenpar` decreases the `\looseness` of the paragraph.<sup>22</sup> It performs well if the last line of the paragraph is short or the whole paragraph is loose.

`prolongpar`

This environment increases the `\looseness` of the paragraph, which is why it works best with decent or tight last lines that are almost full.

## 3.8.4 Specialized Environments

We introduce environments not just skips to get the correct behavior – set up all paragraph parameters *before* the paragraph ends – and, at the same time, limit the range of this parameter change.

Environment `covernextindentpar` can be helpful for `case 01`, i. e., a too short last line.

`covernextindentpar` [*<dim>*]

<sup>20</sup> The last line of a paragraph becomes a ›widow‹ (ger. *Hurenkind*) if it starts the following page or column.

<sup>21</sup> The first line of a paragraph is called ›club‹ or ›orphan‹ (ger. *Schusterjunge*) if it appears at the bottom of the page or column.

<sup>22</sup> Command `\looseness` is a  $\text{\TeX}$  primitive [12, p. 103n]. A thorough discussion of the interaction of `\linepenalty` and `\looseness` can be found in Ref. 24.

`covernextindentpar`

The environment asks T<sub>E</sub>X to extend the last line of a paragraph such that it takes at least  $2\text{\parindent}$  (if  $\text{\parindent} \neq 0$ ),  $2\text{em}$  (if  $\text{\parindent} = 0$ ), or  $\langle dim \rangle$  if called with an optional argument.

`openlastlinepar`

The next environment, `openlastlinepar`, takes care of [case O2](#), i. e., a last line in a paragraph that is almost full or completely filled.

```
openlastlinepar[ $\langle dim \rangle$ ]
```

It may resolve [case O2](#) as it attempts to prevent a completely filled line by introducing a partly unshrinkable `\parfillskip`. Without optional argument the threshold of unused last-line length is either  $2\text{\parindent}$  (if  $\text{\parindent} \neq 0$ ) or  $2\text{em}$  (if  $\text{\parindent} = 0$ ). The optional argument  $\langle dim \rangle$  directly sets the gap threshold.

Note that the application of this environment can be successful, this is, a completely filled last line is avoided, but the result may be of [type O1](#) nonetheless.

### 3.9 Spacing

90 % of design is typography.  
And the other 90 % is whitespace.  
— Jeffrey Zeldman

The functions described in this section rely only on plain L<sup>A</sup>T<sub>E</sub>X. No extra packages are required. Compare to the microtype-based functionality of [Sec. 3.10](#).

#### 3.9.1 Wide Space

`\widespace`

Typeset a wide, sentence-ending space as if in `\nonfrenchspacing` mode.

```
\widespace
```

Macro `\widespace` inserts a space that is as wide as the font's sentence-ending space in `\nonfrenchspacing` mode, this is  $\text{\fontdim2} + \text{\fontdim7}$ , but its width is independent of any `\frenchspacing` or `\nonfrenchspacing` settings.

#### *Use Case*

Useful as a sentence-ending space if, for example, the sentence ends in an abbreviation with a period *and* the next sentence should be delimited in a clearer way. ■

### 3.9.2 Looser or Tighter Spacing

The environments in this section directly influence the spacing, this is, they change the width and stretchability of the horizontal space.

They at the one hand act gently by adjusting the spacing only by a small amount. On the other hand they operate decidedly in controlling the glue associated with the adjusted space. The latter also being important to ensure the monotonicity of the different  $\langle level \rangle$ s. However, the strictly managed stretchability/shrinkability may lead to many overfull boxes with `\fussy` or when applied to short lines.

Environments `loosespacing` and `tightspacing` introduce four  $\langle level \rangle$ s of  $\langle looseness \rangle$  or  $\langle tightness \rangle$ , where  $\langle level \rangle = 0$  disables the functionalities. The higher the  $\langle level \rangle$  the looser or tighter the text will be typeset, respectively.

loosespacing  
tightspacing

`loosespacing[ $\langle level \rangle$ ]`

Environment `loosespacing` increases the width of a space by the percentages given in the Tab. 4.

$\langle level \rangle$	Adjustment	Comment
0	n/a	neutral
1	+5 %	default
2	+10 %	
3	+20 %	
$\geq 4$	+30 %	

TABLE 4: Adjustments made by environment `loosespacing` to `\space`-skip. The mapping of  $\langle level \rangle$  to the exact skip definitions are  $1 \mapsto 1.05^{+.5}_{-.1}$ ,  $2 \mapsto 1.1^{+.5}_{-.1}$ ,  $3 \mapsto 1.2^{+.6}_{-.2}$ , and  $\geq 4 \mapsto 1.3^{+.8}_{-.3}$ , where all factors scale with `\dimen2`, the current font's space-width.

The default level of `loosespacing` is 1.

`tightspacing[ $\langle level \rangle$ ]`

Environment `tightspacing` decreases the width of a space by the percentages given in Tab. 5.

$\langle level \rangle$	Adjustment	Comment
0	n/a	neutral
1	-1.25 %	default
2	-2.5 %	
3	-5 %	
$\geq 4$	-10 %	

TABLE 5: Adjustments made by environment `tightspacing` to `\space`-skip. The mapping of  $\langle level \rangle$  to the exact skip definitions are  $1 \mapsto .9875^{+.0125}_{-.5}$ ,  $2 \mapsto .975^{+.025}_{-.5}$ ,  $3 \mapsto .95^{+.05}_{-.5}$ , and  $\geq 4 \mapsto .9^{+.1}_{-.5}$ , where all factors scale with `\dimen2`, the current font's space-width.

The default level of `tightspacing` is 1.

**Note**

At a given *⟨level⟩* the changes of `loosespacing` are much larger than those of `tightspacing`. ■

**Use Cases**

Nudge line breaks or hyphenation points. ¶ Separate clashing descenders and ascenders. ¶ Eliminate rivers. ■

**3.10 Microtype Front-End**

The functionalities are just front-ends of selected macros in package `microtype`. All macros and environments introduced in this section require package `microtype` [17].

**3.10.1 Tracking****Caution**

The tracking changes may interfere with implicit changes of tracking declared with `\SetTracking`. Explicit calls to `\textls` remain in effect. ■

`setfonttracking`

Override the default tracking for all fonts.

```
setfonttracking{⟨delta⟩}
```

The environment `setfonttracking` manages a group for `\lsstyle` of package `microtype`. The change *⟨delta⟩* in tracking is given as multiples of  $\frac{1}{1000}$  em. Positive as well as negative values of *⟨delta⟩* are allowed.

See Sec. 5.3, »Tracking«, and 7, »Letterspacing revisited«, in the documentation of `microtype` [17] for a detailed explanation.

For font combinations involving monospaced fonts (T<sub>E</sub>X lingo: typewriter) an overly large spacing may show up at the borders where fonts change. This is caused by the calculation of the »outer spacing« described in Sec. 5.3 of the `microtype` manual.

Use configuration variable `trackingttspacing` to reduce the outer spacing to a reasonable value either directly at package-load time

```
\usepackage[trackingttspacing={250, 75, 50}]{typog}
```

or with the help of `\typogsetup` in the document *preamble* (after loading `microtype` and `typog`)

```
\typogsetup{trackingttspacing={250, 75, 50}}
```

If the argument of option `trackingttspacing` is omitted the outer spacing defaults to 300, 90, 60.

**Use Cases**

Nudge line breaks or hyphenation points. ¶ Avoid clashes of descenders and ascenders, e. g., for `\smashed` symbols of inline math. – Think of integrals. ¶ Control the length of the last line in a paragraph. ■

## 3.10.2 Font Expansion

setfontshrink  
setfontstretch

Adjust the limits of either only stretchability or only shrinkability and zero the other component, i. e., shrinkability and stretchability, respectively.

```
setfontshrink{⟨level⟩}
setfontstretch{⟨level⟩}
```

A  $\langle level \rangle$  of zero is a no-op. Tables 6 and 7 summarize the values for stretch and shrink in these environments.

$\langle level \rangle$	stretch $\frac{1}{1000}$ em	shrink $\frac{1}{1000}$ em	Comment
0	n/a	n/a	no operation
1	0	5	default
2	0	10	
3	0	20	

TABLE 6: Preconfigured values for shrink inside of environment `setfontshrink`. Note that all stretch values are zero, so the fonts only can shrink.

$\langle level \rangle$	stretch $\frac{1}{1000}$ em	shrink $\frac{1}{1000}$ em	Comment
0	n/a	n/a	no operation
1	5	0	default
2	10	0	
3	20	0	

TABLE 7: Preconfigured values for stretch inside of environment `setfontstretch`. Note that all shrink values are zero, so the fonts only can stretch.

The three (nonzero) shrink limits of `setfontshrink` can be configured with package option `shrinklimits` and – in the same way – the three (nonzero) stretch of `setfontstretch` can be configured with package option `stretchlimits`.

*Use Cases*

Nudge line breaks or hyphenation points. ¶ Control the length of the last line in a paragraph. ■

setfontexpand

Manipulate both, stretch and shrink values at the same time.

```
setfontexpand{⟨level⟩}
```

Table 8 gives an overview of the values associated with  $\langle level \rangle$ .

The six shrink and stretch limits of `setfontexpand` can be configured with package options `shrinklimits` and `stretchlimits`.

$\langle level \rangle$	stretch $\frac{1}{1000}$ em	shrink $\frac{1}{1000}$ em	Comment
0	n/a	n/a	no operation
1	5	5	default
2	10	10	
3	20	20	

TABLE 8: Preconfigured values for shrink and stretch inside of environment `setfont-expand`. Note that both shrink and stretch values are nonzero, so the fonts can shrink or expand.

Notes

- Environment `setfontexpand` shares its `shrinklimits` with `setfontshrink` and its `stretchlimits` with `setfontstretch`.
- These environments do not nail down any font’s expansion but only set up its available range. See Sec. 3.3, »Font Expansion«, in the microtype documentation [17].

Moreover, a text may not ›respond‹ neither to `setfontshrink`, `setfontstretch`, nor `setfontexpand` because  $\text{\TeX}$  already considers it optimal without expansion or within the previous expansion limits, e. g., those set at microtype load time as opposed to typog’s load time. ■

Use Cases

Nudge line breaks or hyphenation points. ¶ Control the length of a paragraph, e. g., to avoid a widow. ■

`nofontexpansion`

Disable the microtype feature ›expansion‹ inside of the environment.

```
nofontexpansion
nofontexpand (alias)
```

The name `nofontexpand` is an alias for `nofontexpansion`.

Use Cases

Nudge line breaks or hyphenation points. ¶ Prevent severe scaling effects in paragraphs strongly manipulated by other means, e. g., `shortenpar` or `prolongpar`. ■

3.10.3 Character Protrusion

`nocharprotrusion`

Disable the microtype feature ›protrusion‹ inside of the environment.

```
nocharprotrusion
```

*Use Cases*

Table of Contents or similar tables with aligned section numbers. ¶ Any table with left- or right-aligned numerals in particular tabular numerals. ¶ Index. ■

**3.11 Sloppy Paragraphs**

Experienced L<sup>A</sup>T<sub>E</sub>X users know that `\sloppy` is more of a problem by itself and not really a viable solution of the »overfull box« syndrom.

We define the macro `\slightlyloppy` and the associated environment, `slightlyloppypar`, with a user-selectable  $\langle sloppiness \rangle$  parameter. The constructions recover the known settings `\fussy` ( $\langle sloppiness \rangle = 0$ ) and `\sloppy` ( $\langle sloppiness \rangle \geq 8$ ), and introduce three intermediate  $\langle sloppiness \rangle$  levels.<sup>23</sup> The default  $\langle sloppiness \rangle$  is 1.

```
\slightlyloppy[ $\langle sloppiness \rangle$ ]  
slightlyloppypar[ $\langle sloppiness \rangle$ ]
```

Table 9 summarizes the adjustments that `\slightlyloppy` makes depending on the  $\langle sloppiness \rangle$  level.

Environment `slightlyloppypar[ $\langle sloppiness \rangle$ ]` mimics L<sup>A</sup>T<sub>E</sub>X's `sloppy-par`, while offering the flexibility of `\slightlyloppy`.

*Use Cases*

Drop-in replacement for `\sloppy`, whether explicit or implicit (think of `\parbox`). ¶ Initial paragraphs in theorem environments (e. g., as defined by `amsmath` or `amsthm`), where the theorem head already takes a lot of space. ¶ Bibliographies as environment `thebibliography` sets `\sloppy`. ■

23 Also compare the findings for `\emergencystretch` in Ref. 23.

`\slightlyloppy`  
`slightlyloppypar`

TABLE 9: Adjustments made by `\slightlyloppy` to various  $\text{\TeX}$  parameters at different levels of  $\langle sloppiness \rangle$ .

$\langle sloppiness \rangle$	$\backslash\text{tolerance}$	$\backslash\text{hfuzz}$ $\backslash\text{vfuzz}$ pt	$\backslash\text{emergencystretch}$ $G$ em	Comment
0	200	.1	0	$\text{\TeX}$ : <code>\fussy</code> default
1	330 <sup>†</sup>	.15	.375 <sup>‡</sup>	
2	530 <sup>†</sup>	.2	.75 <sup>‡</sup>	
3	870 <sup>†</sup>	.25	1.125 <sup>‡</sup>	
4	1410 <sup>†</sup>	.3	1.5 <sup>‡</sup>	
5	2310 <sup>†</sup>	.35	1.875 <sup>‡</sup>	
6	3760 <sup>†</sup>	.4	2.25 <sup>‡</sup>	
7	6130 <sup>†</sup>	.45	2.625 <sup>‡</sup>	$\text{\TeX}$ : <code>\sloppy</code>
$\geq 8$	9999	.5	3	

<sup>†</sup> All intermediate levels set `\pretolerance = \tolerance/2`.

<sup>‡</sup> The intermediate levels scale the amount of available glue  $G$  (indicated in column 4 of the table) for `\emergencystretch` with the actual line length, this means, in these levels

$$\backslash\text{emergencystretch} = G \times \frac{\backslash\text{linewidth}}{\backslash\text{textwidth}}.$$

to prevent excessive stretchability in narrow lines.

### 3.12 Vertically Partially-Tied Paragraphs

L<sup>A</sup>T<sub>E</sub>X provides several macros and environments to tie material vertically – most prominently `samepage` and `minipage`.<sup>24</sup> Typog’s macros and environments constitute more sophisticated but weaker forms of these. They tie only the first or last couple of lines in a paragraph while the rest of the paragraph gets broken into pages by T<sub>E</sub>X in the usual way.

The macros and environments described in this section locally set  $\epsilon$ -T<sub>E</sub>X penalty arrays [6, Sec. 3.8]. In addition the environments `vtietoppar`, `vtiebotpar`, and `vtiebotdisptoppar` explicitly issue a `\par` at the end of the group.

Avoid a club line in each partial paragraph.

`\vtietop`  
`vtietoppar`

```
\vtietop[⟨number-of-lines⟩]
vtietoppar[⟨number-of-lines⟩]
```

Vertically tie the first *⟨number-of-lines⟩* in a paragraph. Zero or one for *⟨number-of-lines⟩* are no-ops. Up to nine lines can be fused. The default is to link three lines.

#### Use Cases

String together the first paragraph right after a sectioning command. ¶ Tie the first line of an itemized, enumerated, or a description list with the paragraph following `\item`.

`\splicevtietop`

Inside of a `list` a one-off solution simply concatenates `\item[...]\vtietop` to fuse the line with the `item#`, the representation of the `enum#`, or the description term with the first paragraph. For a systematic use prefer `\splicevtietop` and apply it as the first thing in the `list` body.

```
\splicevtietop[⟨number-of-lines⟩]
```

Use this macro *inside* of a `list`-like environment to equip each `\item` with `\vtietop[⟨number-of-lines⟩]`. The default *⟨number-of-lines⟩* is three as for any of the `vtie...` functions.

Example for a description list and plain L<sup>A</sup>T<sub>E</sub>X:

```
\begin{description}
  \splicevtietop[2]
  \item[...]
\end{description}
```

Alternatively with package `enumitem` [4]:

```
\begin{description}[first=\splicevtietop[2]]
  \item[...]
\end{description}
```

24 A valuable complement to these is package `needspace` [29] which takes a different approach and reliably works in *mixed* horizontal and vertical mode situations.

or shorter and with the default  $\langle number-of-lines \rangle$ , 3, using the enumitem style `vtietop`:

enumitem style `vtietop`

```
\usepackage{enumitem}
\begin{description}[vtietop]
  \item[...]
\end{description}
```

Avoid a widow line in each partial paragraph.

`\vtiebot`  
`vtiebotpar`

```
\vtiebot[ $\langle number-of-lines \rangle$ ]
vtiebotpar[ $\langle number-of-lines \rangle$ ]
```

Vertically tie the last  $\langle number-of-lines \rangle$  in a paragraph. Zero or one for  $\langle number-of-lines \rangle$  are no-ops. Up to nine lines can be fused. The default is to link three lines. Avoid a display widow line in each partial paragraph.

`vtiebotdisp`

```
vtiebotdisp[ $\langle before-disp-number-of-lines \rangle$ ]
```

Vertically tie the last  $\langle before-disp-number-of-lines \rangle$  in a paragraph before a display. Zero or one for  $\langle before-disp-number-of-lines \rangle$  are no-ops. Up to nine lines can be fused. The default is to link three lines.

To use the function bracket the paragraph before the display (the one that needs protection) and the associated displayed math:

```
\begin{vtiebotdisp}
  % vertically tied paragraph before the math display
  \begin{equation}
    % math
  \end{equation}
\end{vtiebotdisp}
```

`vtiebotdisptoppar`

Avoid a display widow, compound the display with its preceding *and* following paragraph, and avoid a club line in the paragraph right after the display.

```
vtiebotdisptoppar[ $\langle before-disp-number-of-lines \rangle$ ]
                  [ $\langle after-disp-number-of-lines \rangle$ ]
```

Vertically tie the last  $\langle before-disp-number-of-lines \rangle$  in the paragraph before a display and the first  $\langle after-disp-number-of-lines \rangle$  in the paragraph after the display. Moreover, turn the paragraphs and the display into an un-breakable unit.<sup>25</sup>

Zero or one for  $\langle before-disp-number-of-lines \rangle$  as well as  $\langle after-disp-number-of-lines \rangle$  are no-ops for the respective paragraph. Up to nine lines each can be fused.

<sup>25</sup> The paragraphs and the display are concreted together by setting both `\predisplaypenalty` and `\postdisplaypenalty` to 10000.

Both optional arguments default to three. If only the first argument is given the second acquires the same value.

To use the function bracket the paragraphs before and after the display:

```
\begin{vtiebotdisptoppar}
% vertically tied paragraph before the math display
\begin{equation}
% math
\end{equation}
% vertically tied paragraph after the math display
\end{vtiebotdisptoppar}
```

See also Sec. 3.8.3 for other methods to avoid club or widow lines.

**Partial Paragraphs And Counting Lines.** The top-of-paragraph ties, `\vtietop` and `vtietoppar` count *<number-of-lines>* from the beginning of every partial paragraph. Each displayed math in the paragraph resets the count. The bottom-paragraph ties, `\vtiebot`, `vtiebotpar`, `\vtiebotdisp`, and `vtiebotdisppar` count backward from the end of each partial paragraph. Again, each displayed math in the paragraph resets the count. According to  $\text{\TeX}$ 's rules, a displayed math formula always is counted as *three* lines no matter its contents. Table 10 summarizes these rules with the help of an example.

TABLE 10: Exemplary, eight-line paragraph compounded of two partial paragraphs of three and two lines and a displayed math formula of arbitrary size sandwiched in between.

Continuous Line Number	Example Contents	<code>\vtietop</code> <sup>†</sup> Count	<code>\vtiebot</code> <sup>‡</sup> Count
1	Text line <sub>1</sub>	1	3
2	Text line <sub>2</sub>	2	2
3	Text line <sub>3</sub>	3	1
4	} Display math		
5			
6			
7	Text line <sub>4</sub>	1	2
8	Text line <sub>5</sub>	2	1

<sup>†</sup> This is  $\varepsilon\text{-}\text{\TeX}$ 's counting scheme of `\clubpenalties`; it also holds for `vtietoppar`.

<sup>‡</sup> The same counting scheme also holds for `vtiebotpar`, `\vtiebotdisp`, and `vtiebotdisppar`. It is implied by  $\varepsilon\text{-}\text{\TeX}$ 's line counts of `\widowpenalties` and `\displaywidowpenalties` on which the functions of this package are based.

*Tips*

- The environments can be combined to arrive at paragraphs that simultaneously are protected against club lines and (display) widow lines.
- For very long derivations that are not interrupted and thus made breakable with the help of `\intertext`<sup>26</sup> or `\shortintertext`<sup>27</sup> it is desirable to make the display breakable. This is achieved with `\allowdisplaybreaks` or the environment `breakabledisplay` which will be described in Sec. 3.13. ■

*Use Cases*

Fix widows and orphans, e. g., those turned up by package `widows-and-orphans` [15]. ¶  
 Extend the typographic convention of »three to four lines instead of a single club or widow line« to a context-dependent number of lines that tries to keep all (well, dream on) the information together the reader needs at that particular point. ■

**3.13 Breakable Displayed Equations**`breakabledisplay`

Package `amsmath` offers `\allowdisplaybreaks` to render displayed equations breakable at each of their lines. Environment `\breakabledisplay` is a wrapper around it which limits the macro's influence to the environment. Furthermore, the default *level* of `breakabledisplay` is 3 whereas that of `\allowdisplaybreaks` is 4. This makes `breakabledisplay` less eager to break a displayed equation and thus better suited to full automation of the page-breaking process.

```
breakabledisplay[⟨level⟩]
```

Environment `breakabledisplay` simply passes on *level* to `\allowdisplaybreaks`. Table 11 shows the default penalties that `amsmath` associated with each of the *level*s.

*Tips*

- Terminating a line with `\\*` inhibits a break after this line.
- A `\displaybreak[⟨level⟩]` can be set for *each* line of the displayed equation separately.  $\text{\LaTeX}$  resumes with the original value of `\interdisplaylinepenalty` in the following lines.
- If a discretionary break of the displayed equation is to be accompanied with some aid for the reader, team `\intertext` (or `\shortintertext`) with `\displaybreak` as, e. g.,

```
\newcommand*{\discretionarydisplaybreak}
{\intertext{\hfill Eq.~cont.~on next page.}%
 \displaybreak
 \intertext{Eq.~cont.~from prev.~page.\hfill}} ■
```

<sup>26</sup> Introduced in package `amsmath` [2].

<sup>27</sup> Defined in package `mathtools` [10].

TABLE 11: Penalties `\interdisplaylinepenalty` associated with different  $\langle level \rangle$ s of environment `breakabledisplay`. Depending on the version of package `amsmath` the actual penalties may differ.

$\langle level \rangle$	<code>\interdisplay-</code> <code>linepenalty</code>	Comment
0	10000	no operation
1	9999	
2	6999	
3	2999	
4	0 <sup>†</sup>	

<sup>†</sup> This is the default of `\allowdisplaybreaks`.

Use Cases

Extremely long derivations without interspersed `\intertext` or `\shortintertext`. ■ Draft phase of a document. ■

3.14 Smooth Ragged

The attention someone gives to what he or she makes is reflected in the end result, whether it is obvious or not.  
— Erik Spiekermann

Caution

This set of environments still is experimental. ■

Package `typog` implements a novel approach to typeset ragged paragraphs. Instead of setting the glue inside of a paragraph to zero and letting the line-widths vary accordingly [26] we prescribe the line-widths with the `\parshape` primitive and leave alone the stretchability or shrinkability of the glue.

`smoothraggedrightshapetriplet`  
`smoothraggedrightshapequintuplet`  
`smoothraggedrightshapeseptuplet`

We introduce three environments that allow for setting three, five, or seven different line-lengths: `smoothraggedrightshapetriplet`, `smoothraggedrightshapequintuplet`, and `smoothraggedrightshapeseptuplet`; they work for paragraphs up to 99, 95, or 98 lines, respectively.

```
smoothraggedrightshapetriplet[⟨option...⟩]{⟨width1⟩}{⟨width2⟩}{⟨width3⟩}
smoothraggedrightshapequintuplet[⟨option...⟩]{⟨width1⟩}{⟨width2⟩}...{⟨width5⟩}
smoothraggedrightshapeseptuplet[⟨option...⟩]{⟨width1⟩}{⟨width2⟩}...{⟨width7⟩}
```

The environments take  $N = 3, 5$ , or  $7$  mandatory line-width parameters, where each  $\langle width I \rangle$ ,  $I = 1, \dots, N$  is a skip, i. e., a dimen that can include some glue.

### Options

**leftskip**=⟨dim⟩

Set the left margin for the smooth ragged paragraph to ⟨dim⟩. Similar to the  $\text{\TeX}$  parameter `\leftskip`.

**parindent**=⟨dim⟩

Set the first-line indent for the smooth ragged paragraph to ⟨dim⟩. Similar to the  $\text{\TeX}$  parameter `\parindent`.

smoothraggedrightpar

Environment `smoothraggedrightpar` builds upon the three generators. It typesets a single paragraph with a given  $\langle ragwidth \rangle$  of the ragged, right margin, where the rag width is the length-difference of the longest and the shortest lines.

```
smoothraggedrightpar[⟨option...⟩]
```

The line lengths equally divide the ragged margin, i. e., they are arithmetic means with respect to the generator size.

- The triplet generator repeats a *short line – long line – middle-length line* sequence. Shown below are two complete cycles.

- The quintuplet generator varies the theme of the triplets and avoids the ›ladder‹ of lines 2–3–4 (or, if numbered by cycle: 1.2–1.3–2.1) there. Shown here are two cycles.

- The septuplet generator uses a permutation that looks ›random‹. At least it hides the boundaries of cycles well. Shown here are two of them.

smoothraggedright

Environment `smoothraggedright` is the multi-paragraph version of `smoothraggedrightpar`. It takes the same optional arguments.

```
smoothraggedright[⟨option...⟩]
```

#### Options

**linewidth**=⟨*dim*⟩

Override the length of the longest line. The default line-width is `\linewidth`.

### Global Parameters

#### **\smoothraggedrightfuzzfactor=⟨factor⟩**

The environment adds glue to every line-width<sup>28</sup> to achieve a more convincing »ragged appearance« and to reduce the number of overfull lines. The algorithm divides the smooth margin into 3, 5, or 7 parts depending on the chosen \smoothraggedrightgenerator (see below). The \smoothraggedrightfuzzfactor is the amount of glue of each line expressed as a multiple of the distance between the division points. The default of 1.0 means to add as much glue such that the lines just do not overlap (assuming justification is feasible).

#### **\smoothraggedrightgenerator**

Select a generator to use. Valid generator names:

- triplet,
- quintuplet,
- septuplet.

The default generator is triplet.

#### **\smoothraggedrightleftskip=⟨dim⟩**

Value for leftskip to pass to the generator. Default: 0pt.

#### **\smoothraggedrightparindent=⟨dim⟩**

Value for parindent to pass to the generator. Default: 0pt.

#### **\smoothraggedrighttragwidth=⟨dim⟩**

Value for the width of the ragged right margin. Default: 2em.

### Use Cases

Replacement for \RaggedRight [18]. ¶ Design alternative for fully justified paragraphs if used with a small rag-width. ■

■ ■

28 The shortest line only gets stretchability, the longest only receives shrinkability. All other lines are both stretchable and shrinkable.

## 4 Other Packages for Fine L<sup>A</sup>T<sub>E</sub>X Typography

Many other packages help with getting better output from L<sup>A</sup>T<sub>E</sub>X. Here is a list – in alphabetical order – of the ones the author considers particularly valuable.

- |           |  |
|-----------|--|
| enumitem  | Flexible and consistent definition of all basic L <sup>A</sup> T <sub>E</sub> X-list types plus in-line lists [4].   |
| geometry  | Powerful and sophisticated setup of the page layout [21]. Best accompanied by layout [13] to visualize the page geometries.  |
| hyphenat  | Hyphens that do not inhibit further auto-hyphenation of a compound word [27].  |
| microtype | Fine control of spacing, tracking, sidebearings, character protrusion into the margins, font expansion, and much more [17].<br>See also KHIREVICH's discussion [11]. |
| ragged2e  | Improved versions of environments <code>raggedleft</code> , <code>raggedright</code> , and <code>center</code> [18].   |
| setspace  | Consistently set the document's line-spacing, i. e., <code>\baselineskip</code> [20].  |

## 5 typog-grep

The companion program **typog-grep** for analyzing the output of **typoginspect** and **typoginspectpar** has its own manual page. We reproduce it here for completeness of the documentation.

### NAME

typog-grep - grep for typog-inspect elements in LaTeX log files

### SYNOPSIS

**typog-grep** -a|--all|--any [*OPTION*...] *LOG-FILE*...

**typog-grep** [*OPTION*...] *REGEXP LOG-FILE*...

The first form shows all `<typog-inspect id="ID" ...>` elements in *LOG-FILE*.

The second form shows the contents of `<typog-inspect id="ID" ...>` elements whose *IDs* match *REGEXP* in *LOG-FILE*.

If no *LOG-FILE* is given read from *stdin*. The filename `-` is synonymous to *stdin*.

### DESCRIPTION

**typog-grep** is a tailored post-processor for LaTeX log files and the `typoginspect` environment as provided by package `typog`. It shares more with the venerable **sgrep** than with POSIX **grep**.

The LaTeX user brackets her text in

```
\begin{typoginspect}{ID}
  Text and code to investigate
\end{typoginspect}
```

where *ID* is used to identify one or more bracketed snippets. *ID* does not have to be unique. The *REGEXP* mechanism makes it easy to select groups of related *IDs* if they are named accordingly.

In *LOG-FILE* the environment shows up, packed with tracing information, as

```
<typog-inspect id="ID" job="JOB-NAME" line="LINE-NUMBER" page="PAGE-NUMBER">
  Trace Data
</typog-inspect>
```

all the capital-letter sequences are meta-variables and in particular *JOB-NAME* is the expansion of `\jobname`, *LINE-NUMBER* is the LaTeX source file line number of the beginning of the `typoginspect` environment, and *PAGE-NUMBER* is the page where the output of `Text` and `code` to investigate occurs.

**typog-grep** reveals the contents of *LOG-FILE* between `<typog-inspect id="ID" ...>` and `</typog-inspect>` excluding the XML-tags. Access the *JOB-NAME*, *LINE-NUMBER*, and *PAGE-NUMBER* with the commandline options **--job-name**, **--line-number**, and **--page-number**, respectively. Use **--id** to show the name of the IDs that matched *REGEXP*.

`typoginspect` environments can be nested. **typog-grep** respects the nesting, i.e., if the *ID* of the nested environment does not match *REGEXP* it will not be included in the program's output.

## OPTIONS

The list of options is sorted by the names of the long options.

### **-a, --all, --any**

ID-discovery mode: Show all `typog-inspect` elements independent of any matching patterns.

### **--color, colour WHEN**

Colorize specific log contents for the matching ids. The argument *WHEN* determines when to apply color: `always`, `never`, or `auto`. The setting `auto` checks whether standard output has been redirected. This is the default.

### **-C, --config KEY=VALUE[:KEY=VALUE[:...]]**

Set one or more configuration *KEY* to *VALUE* pairs. See Sec. CONFIGURATION below for a description of all available configuration items. Use option **--show-config** to display the default configuration.

### **--debug**

Turn on debug output on *stderr*.

### **-h, --help**

Display brief help then exit.

**-i, --[no-]id**

Print the actual id name that matched *REGEXP*. Control the appearance of the matching id with configuration item *id-heading*.

**-y, --[no-]ignore-case**

Match ids while ignoring case distinctions in patterns and data.

**-j, --[no-]job-name**

Print the `\jobname` that `tex` associated with the input file.

**-n, --[no-]line-number**

Print the line number where the `typoginspect` environment was encountered in the  
LaTeX source file.

**-N, --[no-]log-line-number**

Print the line number of the *log*-file where the current line was encountered.

**-p, --[no-]page-number**

Print page number where the contents of the `typoginspect` environment starts in the typeset document.

**-P, --[no-]pager**

Redirect output from *stdout* to the configured pager.

**--show-config**

Show the default configuration and exit.

**-V, --version**

Show version information and exit.

**-w, --[no-]word-regexp**

Match only whole words.

**CONFIGURATION****id-format=FORMAT**

Control the *FORMAT* for printing matching ids in inline-mode, where *FORMAT* is passed to Perl's `printf`. Default: `%s:`.

**id-heading=0|1**

Choose between printing the matching ids with option `--id`: Inline (0) or heading before the matching data (1). Default: 0.

`id-heading-format=FORMAT`

Control the *FORMAT* for printing matching ids in heading-mode, where *FORMAT* is passed to Perl's `printf`. Default: `--> %s <--`.

`id-indent=INDENT`

Indentation of nested typog-inspect tags. Only used in “discovery” mode (first form), i.e., if `--all` is active. Default: 8.

`id-max-length=MAXIMUM-LENGTH`

Set the maximum length of a matching id for printing. If a matching id exceeds this length it will be truncated and the last three characters (short of *MAXIMUM-LENGTH*) will be replaced by dots. Default: 40.

`line-number-format=FORMAT`

Control the *FORMAT* for printing TeX source line numbers, where *FORMAT* is passed to Perl's `printf`. Default: `%5d`.

`log-line-number-format=FORMAT`

Control the *FORMAT* for printing log line numbers, where *FORMAT* is passed to Perl's `printf`. Default: `%6d`.

`page-number-format=FORMAT`

Control the *FORMAT* for printing page numbers, where *FORMAT* is passed to Perl's `printf`. Default: `[%3d]`.

`pager=PAGER`

Name of pager application to pipe output into if run with option `--pager`. Default: `less`.

`pager-flags=FLAGS`

Pass *FLAGS* to *PAGER*. Default: `--quit-if-one-screen`.

### Color Configuration

For the syntax of the color specifications consult the manual page of `Term::ANSIColor(pm)`.

`file-header-color`

Color of the filename header.

`fill-state-color`

Color of the messages that report “Underfull hbox” or “Overfull hbox”.

`first-vbox-color`

Color of the first vbox on a page.

`font-spec-color`

Color of font specifications.

`horizontal-break-candidate-color`  
 Color of lines with horizontal-breakpoint candidates @.

`horizontal-breakpoint-color`  
 Color of lines with horizontal breakpoints @@.

`id-color`  
 Color of matching ids when printed inline.

`id-heading-color`  
 Color of matching ids when printed in heading form.

`line-break-pass-color`  
 Color of the lines showing which pass (e.g., @firstpass) of the line-breaking algorithm is active.

`line-number-color`  
 Color of TeX-source-file line numbers.

`log-line-number-color`  
 Color of log-file line numbers.

`math-color`  
 Color used for math expressions including their font specs.

`page-number-color`  
 Color of page numbers of the final output.

`tightness-color`  
 Color of lines with Tight/Loose hbox reports.

`vertical-breakpoint-color`  
 Color of possible vertical breakpoints.

### Brief summary of colors and attributes

#### Foreground Color

`black`, `red`, `green`, `yellow`, `blue`, `magenta`, `cyan`, `white`,  
 Prefix with `bright_` for high-intensity or bold foreground.

#### Foreground Grey

`grey0`, ..., `grey23`

#### Background Color

`on_black`, `on_red`, `on_green`, `on_yellow`, `on_blue`, `on_magenta`, `on_cyan`,  
`on_white`  
 Replace `on_` with `on_bright_` for high-intensity or bold background.

Background Grey

on\_grey0, ..., on\_grey23

Text Attribute

bold, dark, italic, underline, reverse

## EXIT STATUS

The exit status is 0 if at least one *ID* matched *REGEXP*, 1 if no *ID* matched *REGEXP*, and 2 if an error occurred.

## SEE ALSO

`grep(1)`, `printf(3)`, `Term::ANSIColor(pm)`

## Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in **roman** refer to the code lines where the entry is used.

In the Index page ranges are stuck together with `\figuredash*`.
