TypoG – Typographic Fine-Tuning

Ch. L. Spiel*

v0.4 2024/07/08

Abstract

Package typog provides macros and environments for (micro-)typographic enhancements. It also supplies some means to avoid common typographic problems as, for example, orphan or widow lines. Moreover it supplies high-level front-ends for packages microtype and setspace.

This package is copyright © 2024 Ch. L. Spiel. It may be distributed and/or modified under the conditions of the LATEX Project Public License (LPPL), either version 1.3c of this license or – at your option – any later version. This work has the LPPL maintenance status »author-maintained«.

Quick Reference

We reduce the line spacing in the multi-column parts to 120% with \setbaselineskippercentage .¶ List \items get tied with \vtietop.

This is an alphabetically sorted list of all user macros and environments defined by package typog along with the page numbers of their respective descriptions. A list of all package options can be found on page 2 and 4. The Index on pages 108 to 111 may provide some more detailed insights.

If a line-break occurs between described command and its arguments or between any of the arguments we indicate the break with triangle at the end of the initial line and at the beginning of the following line.

\allowhyphenation (Re-)enable automatic hyphenation.	10	\capitalhyphen Typeset a vertically adjusted hyphen charac

1 Introduction 1

1 Introduction

»Good typography« is the minimum acceptable solution; »fine typography« is what we aspire to. — ILENE STRIZVER

IATEX is the beginning of good typesetting – not the end. This package provides some tools for even better looking documents. When applied correctly its effects appear subtle and inconspicuous.

1.1 Overview

Package typog focuses on (micro-)typographic improvements.

Section 3.2 tends to the wish for more information in the typesetting process whether during the draft phase or in the final printed manuscript.

Section 3.3 expands the hyphenation facilities of LATEX.

Sections 3.4 to 3.7 deal with vertically positioning glyphs in a more pleasant way. Also in the realm of vertical alignments is Sec. 3.8 that explains how to height-adjust the labels in itemize lists to perfection whether the items are followed by uppercase or by lowercase letters.

Sections 3.9 and 3.10 discuss dearly missed macros for better control of the last line of a paragraph.

Section 3.11 covers the manipulation of the length of a paragraph.

Section 3.12 expounds on the microtype front-end: font tracking (3.12.1), font expansion (3.12.2), and character protrusion (3.12.3).

In Sec. 3.13 we address some shortcomings of spacing control with a replacement for the macro \sloppy and the related environment sloppypar.

Section 3.14 presents several special functions to avoid club or widow lines in a paragraph.

As a simple extension of displayed mathematical equations we define a breakable variant in Sec. 3.15.

Section 3.16 introduces the setspace front-end.

In the last part, Sec. 3.17, we introduce a novel way of generating ragged paragraphs, which still is experimental.

1.2 Prerequisites

Package typog requires ε -TEX; it relies on the LATEX3 interface. Parts of it are based on package microtype. However, if the respective functionality is not used, typog can be used without microtype. The same holds true for the setspace front-end.

The package was tested with **pdfTeX** 3.141592653-2.6-1.40.24 from the TeX Live distribution of 2022 as shipped by Debian.

Throughout the whole document we indicate actual uses of the package's features in the margin. All these notes are examples themselves as they are typeset with slightly-sloppy, loosespacing, and smoothraggedrightpar. ¶ The title page has already demonstrated the effect of last-linecenteredpar in justified paragraphs for the abstract

and the copyright notice.

2 PACKAGE OPTIONS 2

2 Package Options

Package typog does not override any existing macros or environments when loaded, unless explicitly told by a package option.

```
\usepackage[...]{microtype} % Only required for macros and % environments in Sec. 3.12.

\usepackage[...]{setspace} % Only required for macros in Sec. 3.16.

\usepackage[\langle OPTION \rangle ...]{typog}
```

The package $\langle OPTIONs \rangle$ also serve as configuration $\langle key \rangle$ s (unless noted otherwise). This means they can be set with typogsetup and their values can be retrieved with \typogget. Options that rely on package microtype are indicated with »microtype req.«.

```
breakpenalty=\(\rho enalty\)
```

Penalty for a line break at various points. Default value: 50; initialized by the current \exhyphenpenalty: 50.

debug, nodebug

Write some package-specific debug information to the *log* file. Opposite: nodebug. The default is not to record debug information.

These two options neither can be used with typogsetup nor with \typog-get.

ligaturekern=\langle dim \rangle

Set $\langle dim \rangle$ of the kern that is inserted to split a ligature in macro\nolig. See Sec. 3.4. Default value: $^{33}/_{1000}$ em.

lowercaselabelitemadjustments= $\{\langle dim1 \rangle, \langle dim2 \rangle, \langle dim3 \rangle, \langle dim4 \rangle\}$

Vertical shifts $\langle dimN \rangle$ to apply to \labelitem $\langle N \rangle$, where $\langle N \rangle$ is the nesting level of the itemize list starting at one. An empty $\langle dimN \rangle$ is equivalent to 0 pt. The adjustments apply to the lowercase setting (\lowercaseadjustlabelitems). See Sec. 3.8 (in particular subsection >Setup< and Tab. 4 on p. 26) and also configuration option uppercaseadjustlabelitem.

All four lengths default to 0 pt.

Important

Configuring lowercaselabelitemadjustments (or uppercase-labelitemadjustments) does *not* activate the correction mechanism. Use one of the macros \lowercaseadjustlabelitems or \uppercaseadjustlabelitems for that purpose.

This sub-section is typeset with all typog parameters reset to their defaults by wrapping it in a typogsetup environment with an empty argument.

We access all the (default) configuration values with \typogget.

SINCE VO.4

2 PACKAGE OPTIONS

mathitalicscorrection=\langle dim \rangle

Italics correction in math mode. See Sec. 3.5 and also the complementary configuration option textitalicscorrection. Default value: 0.4mu.¹

3

raise*=⟨dim⟩

Set the length by which selected characters (dash, hyphen, times, and number dash) are raised. Default value: 0 pt.

Only the raise amounts for guillemets are unaffected by this option.

This option neither can be used with typogsetup nor with \typogget, however, the specific options influenced by it can.

raisecapitaldash=\(dim\)

Set the length that the \textendash is raised in \capitaldash. See Sec. 3.7.2. Default value: 0 pt.

raisecapitalhyphen= $\langle dim \rangle$

Set the length that the hyphen character - is raised in \capitalhyphen. See Sec. 3.7.1. Default value: 0 pt.

raisecapitaltimes=\langle dim \rangle

Set the length that the multiplication symbol \times is raised in \capitaltimes. See Sec. 3.7.4. Default value: 0 pt.

raisecapitalguillemets=\langle dim \rangle

Set the length that single and double guillemets are raised in the uppercase versions of the guillemet macros. See Sec. 3.7.5. Default value: 0 pt.

raiseguillemets=\langle dim \rangle

Set the length that single and double guillemets are raised in the lowercase versions of the guillemet macros. See Sec. 3.7.5. Default value: 0 pt.

raisefiguredash=⟨dim⟩

Set the length that the \textendash is raised in \figuredash. See Sec. 3.7.3. Default value: 0 pt.

 $shrinklimits = \{\langle limit-1 \rangle, \langle limit-2 \rangle, \langle limit-3 \rangle\}$ microtype req. stretchlimits= $\{\langle limit-1 \rangle, \langle limit-2 \rangle, \langle limit-3 \rangle\}$ microtype req.

Set the three limits, given in 1/1000 em, of shrinkability and stretchability for the respective levels. They are used in setfontshrink (shrinklimits triple only), setfontstretch (stretchlimits triple only), and setfontexpand (both triples of limits). See Sec. 3.12.2.

New (limit-#) values replace old ones. If one or more limits of the triple should remain unchanged pass a * instead of a number.

Defaults for shrinklimits are 5, 10, 20 and those for stretchlimits are 5, 10, 20.

Both options can be used when loading the package and in the document preamble, but *not* in the document body.

This description list

is protected against breaking items across pages within the first three lines by vtietop.

Note that 1 mu is 1/18 em of the mathematical font's em.

2 PACKAGE OPTIONS 4

slashkern=⟨dim⟩

Set the size of the kerns before and after \kernedslash. See Sec. 3.6.1. Default value: 50/1000 em.

textitalicscorrection=\langle dim \rangle

Italics correction fallback-value; used if \fontdimen1 is zero. See Sec. 3.5 on manual italic correction and also the complementary configuration option mathitalicscorrection. Default value: 29,1000 em.

$trackingttspacing=\{\langle outer-spacing \rangle\} \quad microtype \ req.$

Set the outer spacing of all typewriter fonts if used in environment settracking as described in Sec. 3.12.1.

The argument (*outer-spacing*) gets passed to microtype's \SetTracking option outer spacing [21, Sec. 5.3]. If it contains commas, enclose the whole argument in curly braces. Default argument value: 300, 90, 60.

The option can be used when loading the package and in the document preamble, but *not* in the document body.

By default this option is unset.

uppercaselabelitemadjustments= $\{\langle dim1 \rangle, \langle dim2 \rangle, \langle dim3 \rangle, \langle dim4 \rangle\}$

SINCE VO.4

Vertical shifts $\langle dimN \rangle$ to apply to \labelitem $\langle N \rangle$, where $\langle N \rangle$ is the nesting level of the itemize list starting at one. An empty $\langle dimN \rangle$ is equivalent to 0 pt. The adjustments apply to the uppercase setting (\uppercaseadjustlabelitems). See Sec. 3.8 (in particular subsection >Setupercaseadjustlabelitems) and Tab. 4 on p. 26) and also configuration option lowercaseadjustlabelitem.

All four lengths default to 0 pt.

Important

Configuring uppercaselabelitemadjustments (or lowercase-labelitemadjustments) does *not* activate the correction mechanism. Use one of the macros \uppercaseadjustlabelitems or \lowercaseadjustlabelitems for that purpose.

3 Macros and Environments

Easy things should be easy, and hard things should be possible.

— LARRY WALL

This is the »User Manual« section of the documentation, where we describe all user-relevant macros and environments that are defined in package typog.

We follow the naming convention that every environment whose name ends with ...par issues a \par at its end. Environments with different name suffixes never close with \par.

3.1 Setup and Reconfiguration

typogsetup (env.)

Configure the package with the given $\langle keys \rangle$. An empty argument of typogsetup resets all $\langle keys \rangle$ to their default values.

```
\begin{typogsetup}{\langle keys\rangle} ... \end{typogsetup}
```

The package can be (re-)configured at any point with $\typogsetup{\langle keys \rangle}$, or – for localized changes – as

```
\begin{typogsetup}{\keys\}
...
\end{typogsetup}
```

where $\langle keys \rangle$ have the same format as the package options described in Sec. 2.

Note

Use \PassOptionsToPackage{ $\langle keys \rangle$ } {typog} to pass $\langle keys \rangle$ to typog before loading it and \typogsetup{ $\langle keys \rangle$ } after \usepackage{typog}.

Use Cases

\typogsetup can substitute configuring the package at load-time or serve as an addition. ¶ Using the typogsetup environment allows to fine-tune the parameters for a specific use, e. g., display-sized text. ¶ It even is conceivable that a well-established typog-configuration gets attached to font-changing macros like \rm, \sf, etc.

\typogget

Sometimes the user needs to access configuration values of package typog. This can be done in a safe way without resorting to code that is bracketed by \make-atletter and \makeatother with the help of the following macro.

```
\typogget{\langle key\rangle}
```

Retrieve the configuration value that is associated with $\langle key \rangle$. For a list of available $\langle key \rangle$ s see Sec. 2.

Use Case

Raise glyphs by the same amount as configured with typog.

The latter only is useful inside of an itemize environment of course. Compare with the solution in Sec. 3.8 offered by typog since v0.4.

\typoggetnth SINCE V0.4

If a configuration item is associated with a list as lowercaselabelitem-adjustments, shrinklimits, stretchlimits, trackingttspacing, and uppercaselabelitemadjustments are, it may be convenient to fetch a particular list element of it.

```
\typoggetnth{\langle \textit{csname} \rangle} \{\langle \textit{key} \rangle\} \{\langle \textit{index} \rangle\} \\ \typoggetnth{\langle \textit{dimen-register} \rangle} \{\langle \textit{key} \rangle\} \{\langle \textit{index} \rangle\} \\
```

Retrieve the configuration value – which is a comma-separated list – that is associated with $\langle key \rangle$ and store the item having position $\langle index \rangle$ in $\langle dimen-register \rangle$ or the parameter-less, global macro $\langle csname \rangle$. The destination $\langle dimen-register \rangle$ may be predefined like, e.g., \dimen0 or user-defined. Dimensions can also be stored in a macro by using the $\langle csname \rangle$ form of \typoggetnth but not *vice versa*.

Index into the list either from left-to-right with positive indices starting at 1 up to the length of the list, or from right-to-left with negative indices starting at -1 down to the negative length.

Note

Macro \typoggetnth *only* works with $\langle key \rangle$ s that are associated with a list of values.

3.2 Information

The em-dash at then end of the quote is height-adjusted with \capitalemdash*.

```
Never forget: The visual output counts; it must always be checked, [...].

— UDO WERMUTH [28]
```

We define some functions for introspection of the typesetting process.

3.2.1 Font Information

\fontsizeinfo

Capture the font size² and line spacing³ at the point where \fontsizeinfo *is called* in macro $\langle cs\text{-}name \rangle$. Both dimensions are measured in points (pt) and the results are rounded to tenths.

```
\fontsizeinfo\{\langle cs-name\rangle\}
```

The call to \fontsizeinfo introduces a pair of macros to access the stored values. The unstarred version \cs-name expands to the lengths including their

- 2 We use \fontdimen6, the em-height as the font size.
- 3 The line spacing simply is \baselineskip.

units (i. e., pt), the starred version \cs-name* omits the units. The separating slash is \kernedslash, which is introduced in Sec. 3.6.1.

Note

The \baselineskip can contain a rubber (stretch/shrink) component, however, \fontsizeinfo will not display these parts.

Use Cases

Colophon. ¶ Font test pages.

3.2.2 Paragraph- and Page-Breaking Trace

typoginspect (env.)
typoginspectpar (env.)

The environments typoginspect and typoginspectpar turn on the tracing of paragraphs and pages; optionally they display the parbox' contents. These environments can assist the user in identifying typographic problems in a quantitative way without getting distracted by unrelated information in the trace or the *log*-file.

```
\begin{typoginspect} [\langle option \rangle] \{\langle id \rangle\} \dots \\ begin{typoginspectpar} [\langle option \rangle] \{\langle id \rangle\} \\ \dots \\ begin{typoginspectpar} \\ \end{typoginspectpar} \end{typoginspectpar}
```

The $\langle id \rangle$ is an arbitrary string that identifies the results in the *log*-file. If the mandatory argument is empty, typog constructs a unique value.

Option

tracingboxes $[=\langle size \rangle]$

Specify the maximum box breadth and box depth reported in the log. If $\langle size \rangle$ is omitted the maximum values are assumed; this is similar to the \tracingboxes macro [1, p. 312].

Caution

The end-of-trace marker sometimes gets placed too early and the trace seems truncated. IAT_EX reliably logs the requested trace information, but the write operations for trace data and \immediate\write which is used to print the end-tag are not synchronized.

LATEX log-file and trace. The trace data in the log-file is bracketed by XML-tags.

```
<typog-inspect_id="\langle id \rangle"_job="\langle jobname \rangle"_line="\langle line-number \rangle"_page="\langle page-number \rangle">
...
</typog-inspect>
where the \langle id \rangle is the user-supplied, unique<sup>4</sup> identifier of the group, \langle jobname \rangle is
```

the value of \jobname, \langle line-number \rangle records the \inputlineno of the \be-

4 It has turned out advantageous to use unique $\langle id \rangle$ s. However, $\langle id \rangle$ s are not required to be distinct.

This itemize list demonstrates vertically adjusted label items (Sec. 3.8).

gin of the group, and $\langle page-number \rangle$ gets replaced with the current value of the page counter.

- Any text tool can be used to ferret out the tags. EMACS users will find (occur $\langle regexp \rangle$) to be useful.
- As long as the tags are not nested sed or perl extract the information gathered by typoginspect, for example:

 The companion program typog-grep is tailored to extract the information marked up by typoginspect and typoginspectpar even if the environments are nested.

We reproduce the complete manual page of typog-grep in Appendix B.

Tips

 It may be necessary to run whatever LATEX engine with a larger log-file line length, to prevent wrapped lines. With short lines the wannabe XML opening tags can get wrapped and thus become unrecognizable to dumb postprocessors. To avoid wrapped lines prepend

```
/usr/bin/env max_print_line=2147483647
```

to the command-line. The value 2147483647 = 2^{31} – 1 effectively disables all line wrapping by LATeX.

As both **pdflatex** and **lualatex** support changing their configuration on a by-call basis with option $-cnf-line=\langle STRING \rangle$ an alternative to the above example is to add

```
-cnf-line=max_print_line=2147483647
```

to the respective command-line.

- If more trace information is needed just add \tracing... calls right after \begin{typoginspect} or \begin{typoginspectpar}.
- As the overhead of \typoginspect is relatively low, hairy parts of a document can permanently be furnished with them, for example, the Index.
- Any labeled part can treat their ids to $\langle id \rangle$. Think of \captions or any theorem-like environment and their associated, unique \labels.

Investigating the badness of a paragraph. It is generally unnecessary to determine the *exact* classification of a paragraph's badness [14, p. 97n], though the curious user can switch on logging of TEX's line-break information with \tracing-paragraphs=1⁵ or simply use the typoginspect environment and check the suffixes

@@ $\langle breakpoint-number \rangle$ line $\langle line-number \rangle$. $\langle suffix \rangle$ of each line in the paragraph, where for $\langle suffix \rangle$ the following mapping holds [14, p. 99]:

 $0 \mapsto \text{very loose}, \quad 1 \mapsto \text{loose}, \quad 2 \mapsto \text{decent}, \text{ and} \quad 3 \mapsto \text{tight}.$

Example

```
@@17: line 15.1- t=142289 s=93.58414 a=2.86073 -> @@16
```

- 1. The feasible breakpoint @@ number 17 in the paragraph leads to
- 2. [line 15, which is the loose . 1 last _ line of the paragraph.
- 3. Up to this breakpoint the paragraph has picked up total demerits to of 142289.
- 4. The following two values only show up if $\lceil \text{lastlinefit} \neq 0 \rceil$:
 - (a) The shortfall s and
 - (b) glue a or g.6
- 5. The best way to get here, i. e., @@17 is via _-> breakpoint @@ 16.

Note

When package microtype's font expansion feature jumps in the reports on »Loose \hbox (badness ...)« and »Tight \hbox (badness ...)« contain the amount of shrinking or expansion as parenthesized values (units are thousandths of the current font's em) like, e. g.,

```
\label{eq:total_continuous} $$ T1/erewhon-LF/m/n/9/@/@ (-13) ... $$ or $$ T1/erewhon-LF/m/n/9/@/@/10ls (+7) ... $$
```

An ls appended to the font name specification indicates that microtype's letter spacing feature is active and changed the tracking by that many thousands on an em as indicated before ls.

- 5 Reference 27 provides an exceptionally detailed discussion of the output of \tracingparagraphs.
- 6 The author is unaware of any descriptions of <code>s</code>, <code>a</code>, or <code>g</code> and the interested reader is referred to the source code, e. g., <code>pdftex.web</code>; search for <code>print("_s=")</code>. In the weaved documentation the first relevant section is \$1851.
- 7 >Best< means the minimum-demerits path in the graph of the feasible breakpoints, which has been constructed for the paragraph.

All of our guillemets were raised by ³³/₁₀₀₀ em.

Investigating page-breaks. Use \tracingpages=1 or the typoginspect environment to switch on tracing of T_EX's page-break information [14, p. 112n].⁸

The first time vertical material enters a new page, TEX logs

%% goal height= $\langle text-height \rangle$, max depth= $\langle max-depth \rangle$ where $\langle text-height \rangle$ is the total height TEX wants to achieve and $\langle max-depth \rangle$ is the maximum depth of the hbox in the last line of the page is allowed to have without considering $\langle text-height \rangle$ to be exceeded. For example:

```
%% goal height=598.0, max depth=5.0 For every vertical breakpoint TeX records % t=\langle total-height \rangle g=\langle goal-height \rangle b=\langle badness \rangle p=\langle penalty \rangle
```

 $c = \langle cost \rangle$ Here, $\langle total\text{-}height \rangle$ and $\langle goal\text{-}height \rangle$ are the current total height of the page and the current goal height to achieve with respect to this vertical breakpoint.

The value of $\langle penalty \rangle$ and $\langle cost \rangle$ can be infinite, which would be indicated with an asterisk \star instead of a numerical value. The best vertical breakpoint found so far on the current page is indicated by a trailing sharp-sign #.

Example

% t=351.3 plus 11.0 minus 1.0 g=553.9 b=10000 p=-300 c=100000#

- 1. At this vertical breakpoint the total page height <code>t</code> is 351.3 pt. We have picked up glue with 11 pt stretchability and 1 pt shrinkability along the way.
- 2. The current goal height g is 553.9 pt. If the initial goal height was 598 pt we can deduce that some space for other vertical material was subtracted.
- 3. The badness b of this vertical break is horrendous which is expected for the first lines on a page since breaks so early are rightfully considered infinitely bad.
- 4. The penalty p^{γ} at this point actually is a bonus.
- 5. As the badness is 10000 the cost for a break is calculated to 100000.

3.3 Hyphenation

TEX's and thus IATEX's hyphenation algorithm is highly sophisticated, yet the document author sometimes lacks convenient macros to solve seemingly trivial typographic tasks. For example, to hyphenate a compound word connected by a hyphen.

 $T_E\!X$ inhibits breaks of the component words by default. The following macro rectifies the problem.

\allowhyphenation

Macro \allowhyphenation re-enables automatic hyphenation after $T_E X$ has turned it off, for example, in the innocuous case of a hyphenated compound.

The admittedly simple rules when T_EX auto-hyphenates and when not give rise to so many different, yet interesting cases that we devote Tab. 1 to them. The seemingly special cases shown there are not that uncommon, e.g., consider >spin-1/2<

\allowhyphenation

8 See also the discussion of the T_EX output routines by SOLOMON [23].

which is coded as $\mbox{spin-\textfrac}\{1\}\{2\}\}$. A line break between the text and the fraction would garble the term.

Use Cases

All examples from the bottom of Tab. 1 on p. 12. ¶

Fix line breaks of index-entries in a narrow index:

Halbgruppe, Transformations\allowhyphenation\mbox{-}\,---

The first part, 'Transformations' is allowed to be hyphenated, but a break after the hyphen is prohibited as it results in a prowling em-dash at the beginning of the next line.

Re-enable hyphenation when a macro decays into a \hbox:

```
Einselement\allowhyphenation\rlap{,}\footnote{...}
```

where \rlap is equivalent to something like \makebox[0pt]{#1\hss}.¶

Use \allowhyphenation to turn on hyphenation of the first word of a paragraph as, e.g., in a narrow index or a \marginpar:

```
\marginpar{\allowhyphenation Kontakttransformationen}
```

A common trick to sweet-talk T_EX into hyphenating the first word of a paragraph is to put \hskip@pt in front of it.

Whenever using $\-$, the short-hand form of $\discretionary{-}{}{}$, authors writing in a foreign language should reconsider whether it really beats \hgapha beats \hgapha ation or \hgapha beats \hgapha in the particular situation. However, sometimes $\-$ actually is the way to go.

Let us assume we mark up proper names with

and we want to have hyphenatable »ABELsche Gruppe« or »EUKLIDischer Vektor-raum« without dropping the markup. To that end we define commands that insert a hyphenation point at the right place:

which are impossible to encode with \hyphenation or \babelhyphenation as these expect only letters and dashes as their arguments with spaces separating the words.

TEX never hyphenates the initial word in a paragraph and \allowhyphenation cannot help in this case. Start the paragraph with \hskip Opt to enable hyphenation even for the first word.

Tip — Typewriter Fonts

Sometimes it is desired to get a hyphenatable typewriter font. IATEX suppresses any hyphenation for fonts in \ttfamily by un-defining their \hyphenchars. If these are reassigned, the usual hyphenation occurs again.

So, a fictitious macro '\code' to typeset short pieces of code could look like this:

^{9 \}babelhyphenation is the multi-lingual extension of TeX's \hyphenation and it is defined in package babel [5].

TABLE 1: T_EX offers plenty of possibilities to hyphenate a compound. \P We use the sample >hyphenated-compound< to show various code examples and the results that they produce. The parts are automatically hyphenated like this: >hyphenated< \rightarrow >hy-phen-ated< and >compound< \rightarrow >com-pound<.

LAT _E X-Code	Result	Note		
hyphenated-compound	hyphenated- compound	Most frequently used code; the hyphen <code>-</code> expands to \dis-cretionary{-}{}{-} rendering the parts un-breakable		
<pre>hyphenated\mbox{-}% compound</pre>	hyphenated-compound	Suppress hyphenation with the \mbox in the compound		
<pre>\mbox{hyphenated-% compound}</pre>	hyphenated-compound	Avoid line break and thus hyphenation		
hyphenated\hyp compound	hy- phen- ated- com- pound	Macro \hyp defined in package hyphenat [34]		
hyphenated% \allowhyphenation-% compound	hy- phen- ated- compound	Macro \allowhyphenation of package typog; only unblock hyphenation of the first part		
hyphenated-% \allowhyphenation compound	hyphenated- com- pound	Macro \allowhyphenation of package typog; only unblock hyphenation of the second part		
hyphenated% \allowhyphenation \mbox{-}% compound	hy- phen- ated-compound	Macro \allowhyphenation of package typog; hyphenate first part and keep the original hyphen unbreakable		
hyphenated% \allowhyphenation-% \allowhyphenation compound	hy- phen- ated- com- pound	Macro \allowhyphenation of package typog; hyphenate both parts, similar to \hyp shown above		

\breakpoint \breakpoint* The empty discretionary construct [14, p. 95], $\discretionary\{\}\{\}\}$, is so helpful that it deserves its own macro – with a descriptive name.

```
\breakpoint*
```

The starred form inserts an empty discretionary, which disables automatic hyphenation. The unstarred form inserts an empty discretionary and immediately re-enables automatic hyphenation.

The difference between \breakpoint and the LATEX macro \allowbreak is not only that the former has a starred form, but the penalty associated with \breakpoint is the current \extrm{10} \exhyphenpenalty, whereas \allowbreak statically assigns a zero penalty.

Use Case

Prefixes that end in a hyphen inside of a pair of parenthesis:

```
\label{local_mbox} $$ \mbox{(pre-)}\\ \ \ \ \ \ $$ \propername{Hilbert} \ space $$\blacksquare$ $$
```

hyphenmin (env.) SINCE VO.3

Set the values of \lefthyphenmin and \righthyphenmin confined to an environment.

```
\begin{hyphenmin} [\langle \textit{left-hyphen-minimum} \rangle] \{\langle \textit{hyphen-minimum} \rangle\} \\ \dots \\ \\ \end{hyphenmin}
```

Without optional argument hyphenmin sets both \lefthyphenmin and \righthyphenmin to $\langle hyphen-minimum \rangle$. When called with an optional argument it sets \lefthyphenmin to $\langle left-hyphen-minimum \rangle$ and \righthyphenmin to $\langle hyphen-minimum \rangle$.¹¹

Use Case

If the hyphen minimums were *increased* e.g. in the preamble: Reduce the hyphen minimum in the index or other multi-column environments with narrow lines to regain hyphenation possibilities. \P Use a large $\langle hyphen-minimum \rangle$ to disable hyphenation.

¹⁰ At this point in the document \exhyphenpenalty=50 holds.

¹¹ The current values for \lefthyphenmin and \righthyphenmin in this document are 2 and 3, respectively.

3.4 Disable/Break Ligatures

\nolig* Break a ligature without introducing a hyphenation opportunity.

```
\nolig*[{kerning}]
```

Inserting $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern. Set the size of the kern with $\noline *$ disables a ligature at the given point by a kern.

Use Cases

\nolig* can be useful in headings, where additional hyphenation points are unwelcome. ¶ In fonts with an overly rich set of ligatures \nolig* offers a straightforward means to suppress unwanted ligatures at non-hyphenatable positions. ¶ Rectify the appearance of a pseudo ligature, i. e., two adjacent characters that look like a ligature, but actually are not.

\nolig Break a ligature and introduce a hyphenation opportunity.

```
\nolig[{kerning}]
```

Inserting \nolig disables a ligature at the given point as \nolig* does and introduces a hyphenation opportunity with penalty breakpenalty.

Important — hyperref bookmarks

If a \nolig - whether starred or un-starred - occurs in an argument that is processed with package hyperref for inclusion into the document's PDF-bookmarks an additional argument is necessary to parse the macro. This argument either is \relax or the empty group ({}).

The prototypical places where this processing-for-PDF-bookmarks happens are the sectioning macros, e.g., \chapter, \section, \subsection, etc.

LATEX will bail out with an error if the extra argument is not passed to \no-lig in these situations.

Alternatively use \texorpdfstring [20, Sec. 4.1.2, p. 22].

Use Cases

\nolig can be used with just about any ligature that needs to be split into its parts. ¶
It also has proven beneficial in separating pairs of characters that are kerned to tightly (e. g. the <code>ij</code>, as in bijection, which is particularly distractive here, for it occurs at the boundary of two syllables). ■

3.5 Manual Italic Correction

\itcorr \itcorr* The italic correction offered by T_EX or LAT_EX sometimes needs a helping hand.

```
\itcorr{\langle strength\rangle}
\itcorr*{\langle strength\rangle}
```

In text mode macro \itcorr inserts a kern whose width is proportional to \fontdim1, which is the font's italic correction. If \fontdim1 happens to be zero (e.g. for an upright font), \itcorr uses the value set with textitalics-correction instead of \fontdim1. The starred version always uses textitalicscorrection. In math mode macro \itcorr uses the value set with mathitalicscorrection in both the starred and the unstarred form.

Typical slant angles of serif italics fonts range from 8° to 18° and thus values for textitalicscorrection from .14 to .32. Note: $\langle strength \rangle$ can be negative and fractional $\langle strength \rangle$ s are allowed.

Use Cases

Stronger or weaker correction than \/.¶ Correct a non-slanted or non-italicized font.¶ Negative correction at the left-hand side 13 of italics, i. e., compensate »shift-to-the-right effect« of italics.¶ Positive correction at the left-hand side of italics, e. g., an opening parenthesis or square bracket followed by an italic f (before: 8, after: 7) or y (before: 4, after: 1) reaching far to the left below the baseline. ■

The $\langle strength \rangle$ parameter explained. TEX records the slant angle α of a font in \backslash fontdim1 as 1 pt \times sin α . Rephrased the formula means: How much horizontal space is required for a letter slanted with α that is 1 pt high? So, \backslash itcorr{ $\langle strength \rangle$ } calculates

$$\langle strength \rangle \times 1 \text{ pt} \times \sin \alpha$$
.

A well-chosen $\langle strength \rangle$ should be the absolute minimum value which avoids that the glyphs typeset in italics collide with other – usually non-italics – letters or symbols unless this disturbs the consistency of the overall tracking.

Correction of the right-hand side and $\alpha > 0$: A reasonable first guess of $\langle strength \rangle$ is the highest point where the rightmost part of the letter would touch a rule angled at α with respect to the baseline. The correction of the left-hand side and $\alpha > 0$ considers the lowest >touching \langle point below the baseline on the left-hand side of the letter. Negative values of α exchange the reference points.

Figure 1 shows how $\langle strength \rangle$ and α are related. Moreover, it demonstrates how intricate italics correction is.

¹² Separate adjustments may be desirable if the math font's italics have markedly different slants.

¹³ Groff has the machinery for left-italic-correction. Its font-metrics files support per glyph left-italic-correction values and users can access them conveniently via \, \, .

FIGURE 1: Some letters of an italics font. We use the capital $\mathbb{H}^{\!\!\!-}$ to measure the angle α between the plumb-line (drawn dashed) and a tangent to the rightmost parts of the glyph. The length of the plumb-line is proportional to $\langle strength \rangle$ and the short, thick part of the baseline symbolizes the resulting italics correction. \P The middle example, the capital $\mathbb{L}^{\!\!\!-}$, shares α with $\mathbb{H}^{\!\!\!-}$ but obviously needs a far smaller $\langle strength \rangle$ or even no correction at all. \P The $\mathbb{L}^{\!\!\!-}$ at the right-hand side is an example of why $\mathbb{T}_E X$ allows to assign an italic correction to each individual character of a font. Not only features the lowercase $\mathbb{L}^{\!\!\!\!-}$ a larger α – despite being a member of the same font – but its serif adds as much to the width as the slanted stem.

We center the last lines of each figure and table caption with the help of lastlinecentered-par.

3.6 Apply Extra Kerning

Package typog supplies two sets of macros to kern some of the punctuation symbols. One is for forward slashes the other, more extensive one, for hyphens.

3.6.1 Slash

\kernedslash \kernedslash* Macro \kernedslash expands to a forward slash $(\sqrt{\ })$ with some extra space around it.

\kernedslash \kernedslash*

The starred form is unbreakable, the non-starred version introduces a break point with penalty breakpenalty after the slash. Configure the kerning around the slash with slashkern.

If the word following the slash should not be hyphenated append \nobreak after \kernedslash*.

Use Cases

\kernedslash improves the appearance of pairs of years typeset in lining numerals: $\langle year_1 \rangle / \langle year_2 \rangle$. ¶ The macro has proven helpful in many cases where the right hand side of the slash starts with a capital as, for example, $\langle city \rangle / \langle state-code \rangle$ (US-specific) or $\langle anything \rangle / \langle noun \rangle$ (any language that capitalizes $\langle noun \rangle$).

3.6.2 Hyphen

\kernedhyphen \kernedhyphen* Macros \kernedhyphen* and \kernedhyphen expand to a hyphen (-) with given kerning to its left and to its right.

Typeset an unbreakable hyphen with \kernedhyphen* or a breakable hyphen (like \hyp of package hyphenat [34]) with \kernedhyphen and apply some kerning to left and to the right of it. The values \langle left-kerning \rangle and \langle right-kerning \rangle are multiplied with one thousandth of the current font's em to get the size of the kern.

The optional argument $\langle raise \rangle$, also given in 1/1000 em, allows to adjust the height of the hyphen similar to the macros described in Sec. 3.7. In text mode the special argument \star for $\langle raise \rangle$ transfers the current value of raisecapital-hyphen. The default for $\langle raise \rangle$ is zero.

We also define specialized versions for kerning on the left-hand side or the right-hand side only. These macros work like their two-argument counterparts and set the appropriate other kerning to zero.

```
\leftkernedhyphen[\langle raise \rangle] \{ \left-kerning \rangle \} \leftkernedhyphen*[\langle raise \rangle] \{ \left-kerning \rangle \} \rightkernedhyphen[\langle raise \rangle] \{ \langle right-kerning \rangle \} \right \right \rangle right \rangle raise \rangle \] \{ \langle right-kerning \rangle \}
```

Use Cases

Composites in the form $\langle math \rangle - \langle noun \rangle$ in languages where nouns are capitalized. ¶ Composites where one or both sides of the hyphen are typeset in different fonts, like, $\langle small - caps \rangle - \langle roman \rangle$.

3.7 Raise Selected Characters

Usually all hyphens and dashes of a font are designed to join lowercase letters. This holds also true for most of our $\lower{labelitem}\langle N\rangle$ markers, bullets, stars, and even fancy dingbats. If these hyphens and dashes connect uppercase letters (or lining numerals) they sometimes appear to low; they disrespect the glyphs' symmetry axis. A similar situation arises if itemize list markers precede an uppercase letter, a lining numeral, or a big mathematical operator.

We introduce a set of macros for the most common cases that typeset these characters at a user definable, adjusted height above the baseline. Users can base their own definitions of raised characters on their associated dimensions.¹⁴

\leftkernedhyphen \leftkernedhyphen* \rightkernedhyphen \rightkernedhyphen*

Caution

The height adjustment disables a font's built-in kerning.

General note for all raised hyphen-like macros: Prefer the starred version if applied in front of any punctuation.

3.7.1 Capital Hyphen

\capitalhyphen \capitalhyphen* In many fonts the height of the hyphen character z^2 above the baseline is optimized for lowercase letters. In languages that capitalize their nouns as, e. g., German, this may be too low for compounds involving capitals.

```
\capitalhyphen \capitalhyphen*
```

The unstarred version introduces a hyphenation opportunity right after the hyphen character (with penalty breakpenalty) whereas the starred version does not. The actual amount the hyphen gets raised in \capitalhyphen is determined by raisecapitalhyphen.

Use Cases

In languages that capitalize their nouns, the typical use-case is between an $\langle abbreviation \rangle$ and a $\langle noun \rangle$ when $\langle abbreviation \rangle$ is a string of uppercase letters. The same holds true for a connection of an uppercase variable in mathematical mode and a $\langle noun \rangle$ starting with a capital letter. \P Abbreviated compound first names (e.g., A.-M. Legendre) can be joined with the starred version. \P Also, the starred form is suited for ISO 8601-formatted dates if they are composed with lining-style numerals.

3.7.2 Capital Dash

\capitalendash*
\capitaldash
\capitaldash

The situation of the en-dash _- is almost identical to the one of the hyphen character _- described in the previous section or the number dash to be introduced in the next section.

```
\capitalendash \capitaldash(alias)
\capitalendash* \capitaldash* (alias)
```

The unstarred version introduces a hyphenation opportunity right after the dash (with penalty breakpenalty) whereas the starred version does not. The actual amount the hyphen gets raised in \capitaldash is determined by raisecapitaldash.

Use Cases

Letter ranges as used in the title of an index. ¶ Any mixed letter-digit ranges (of capital letters and lining-style numerals) as in e. g., Sec. B–2.

\capitalemdash \capitalemdash* For completeness we also introduce a raised em-dash ___. It behaves just like its en-dash sibling.

\capitalemdash \capitalemdash*

Use Cases

Item symbols in itemized lists if the item text starts with an uppercase letter. \P Theorem headings, like, e. g., Definition 6.2 — LIE Algebra.

3.7.3 Number Dash (Figure Dash)

\figuredash \figuredash*

\figuredash yields 12-34-56-78 for sans-serif and 12-34-56-78 for the roman typeface. The en-dash often gets used as separator for numerical ranges. In most fonts it has the correct height above baseline for oldstyle numerals, e.g. 12-34-56-78, but with lining numerals – depending on the font – it may look like it suffers from »broken suspenders«: 12-34-56-78. The situation is similar to \capitaldash and \capitalhyphen discussed in Secs. 3.7.1 and 3.7.2.

\figuredash \figuredash*

The unstarred version introduces a hyphenation opportunity right after the en-dash with penalty breakpenalty whereas the starred version does not. The actual amount the en-dash gets raised in \figuredash is determined by raisefiguredash.

Values of .05 em to .1 em are typical for fonts that need this kind of correction and .1 em is a good starting point. Table 2 summarizes some findings.

TABLE 2: Suggested values for raising \figuredash, which actually is an en-dash, between lining numerals of some selected fonts in multiples of 1 em.

Font	Raise
Alegreya, Arvo, Bitter, Clara, EB Garamond, Gentium, Ibarra Real Nova, INRIA Serif, Libertine, Libertinus, Merriweather, PT Serif, Roboto Slab,	.0
Spectral, STIX, and many more	
fbb*, Source Serif Pro	.05
Libre Baskerville, Crimson Pro, Erewhon, Droid Serif	.0667
GFS Artemisia, Libre Caslon, Coelacanth, Crimson Pro, Crimson Text, T _E X Gyre Pagella, Quattrocento, TX Fonts, ADF Venturis, and many more	.1

^{*} Free Bembo.

Other macros may be redefined with \figuredash for a consistent appearance of the copy, like, for example, \citedash (package cite [3]), or \crefrangeconjunction (package cleveref [10]).

Use Case

The key customers of \figuredash are the PAGES entries of bibliography databases. ¶ In an index generated with **makeindex** the range delimiter delim_r is a candidate for \figuredash*. ■

3.7.4 Multiplication Sign - Times x

\capitaltimes

The \capitaltimes macro is a variation of the \capitalhyphen theme.

\capitaltimes

In text mode it expands to an appropriately raised \texttimes, and in math mode to a raised \times binary operator, where raisecapitaltimes determines the amount of upward-shifting applied; it never inserts any break points.

Use Case

Prime use are two- or higher-dimensional shape specifications with lining numerals or uppercase letters in mathematical mode as, for example, matrix or tensor sizes.

3.7.5 Guillemets

Another possible typographic problem this package addresses is that both sets – single and double quotes – of guillemets may suffer from a too small distance to the baseline.

For the implementation typog relies on the $\mathrm{T1^{15}}$ font encoding not on package babel.

\singleguillemetleft \singleguillemetright \doubleguillemetleft \doubleguillemetright

Lowercase Versions.

```
\singleguillemetleft \singleguillemetright \doubleguillemetright
```

For consistency and easy accessibility we define height-adjusted left and right single guillemets as \singleguillemetleft and \singleguillemetright; double guillemets are available with \doubleguillemetleft and \doubleguillemetright. Their heights above the baseline are collectively adjusted with raiseguillemets.

15 Font encoding T1 can be forced via \usepackage[T1] {fontenc} in the document preamble.

\Singleguillemetleft
\Singleguillemetright
\Doubleguillemetleft
\Doubleguillemetright

Uppercase Versions.

```
\Singleguillemetleft \Singleguillemetright \Doubleguillemetright
```

The companion set of single, double, left, and right quotes corrected for uppercase letters or lining numerals is \Singleguillemetleft and \Singleguillemetright and \Doubleguillemetleft and \doubleguillemetright. Mnemonic: These macros start with an uppercase letter. Their height above the baseline is adjusted with raisecapitalguillemets. Values of .025 em to .075 em are typical for fonts that need this kind of correction. Table 3 summarizes some findings.

TABLE 3: Suggested values for raising guillemets of some selected fonts in multiples of 1 em.

Font	Uppercase	Lowercase
EB Garamond, Libertinus, Merriweather, and many more	.05	.0
Gentium	.05	.025
GFS Artemisia, GFS Didot	.0625	.05
ADF Baskervald	.0667	.04

Tip

Define shorthand macros that simplify the application of guillemets, like, e. g.,

and similar definitions for \Singlequotes, \doublequotes, and \Doublequotes.

Users working according to the French typesetting conventions will want to add extra spacing between the guillemets and the macro argument already in these macros.

Whether the guillemets must be height-adjusted for lowercase letters depends on the font. Careful judgment at various magnifications with a variety of samples is necessary.

Interaction with package csquotes. The users of package csquotes can hook up the guillemets as defined by typog with \DeclareQuoteStyle:

```
\DeclareQuoteStyle{typog-guillemets}
  {\doubleguillemetright}% opening outer mark
  {\doubleguillemetleft}% closing outer mark
  {\singleguillemetright}% opening inner mark
  {\singleguillemetleft}% closing inner mark
```

As always, the influence of package babel on csquotes has to be put into consideration. See Sec. 8 of the csquotes manual for a description of its configuration possibilities.

Use Case

All-capital words as for example acronyms put in guillemets that are raised somewhat almost always look better, whether using the French typographic convention (guillemets pointing outward plus some extra kerning) or the other way round (guillemets pointing inward).

Anticipated Changes & Possible Extensions

A correction in the other direction, i. e., lowering certain characters may also be desirable, to visually align them to the surrounding copy. Parentheses and in particular square brackets around all-lowercase text come into mind.

3.8 Vertically Adjust Label Items of Environment itemize

Perfection of planned layout is archieved only by institutions on the point of collapse.

— CYRIL NORTHCOTE PARKINSON

The symbols that LATEX uses to distinguish the items of itemize lists do not always align well in the vertical direction with the following text. Sometimes the label is too low, especially if followed by an uppercase (initial) letter. In rare occasions the label is placed too far above the baseline. If any label has been taken from a math-font vertical alignment with the text font is almost purely accidental. 16

\uppercaseadjustlabelitems \lowercaseadjustlabelitems \noadjustlabelitems

ALL THREE SINCE VO.4

Package typog lets the user vertically align the itemize labels for subsequent uppercase or lowercase letters, where the designations >uppercase and >lowercase are just names for two four-tuples of lengths (technically: dimens) to shift the labels up or down.

```
\label{lims} $$ \sup_{\langle levels-to-adjust\rangle} $$ \lowercaseadjustlabelitems {\langle levels-to-adjust\rangle} $$ \\ \noadjustlabelitems {\langle levels-to-adjust\rangle} $$
```

Apply uppercase adjustment, lowercase adjustment or no adjustment to the labels in itemize environments at the *(levels-to-adjust)*. The adjustment values themselves, this is the vertical shifts are configured with options uppercase-labelitemadjustments and lowercaselabelitemadjustments. They

are doubly font dependent: on the one hand the font where the label itself comes from and on the other hand the font of the copy.

The argument ⟨*levels-to-adjust*⟩ is a – possibly empty – comma separated list of the levels the respective adjustments are to be applied to. The levels themselves are given as *decimal* numbers, this is, 1, 2, 3, 4 or the special value * which stands for all four levels. An empty argument list also has a special meaning. Used within any itemize environment it automatically applies the adjustment to exactly this level.

Example

With the flexible syntax the following settings are possible.

▷ Correct all itemize labels for uppercase letters.

```
\uppercaseadjustlabelitems{*}
```

▶ Adjust nesting levels 1, 2, and 3 for uppercase letters and level 4 for lowercase.

```
\lowercaseadjustlabelitems{4}
\uppercaseadjustlabelitems{2,3,1}
```

▶ Within an itemize environment just turn off any correction for this level whatever it may be.

```
\begin{itemize}
\noadjustlabelitems{}
\item ...
\end{itemize}
```

▷ Override \labelitemi with a right-pointing triangle and adjust its vertical position inside of a typogsetup environment.

The observant reader will have noticed that the itemized list in this emphasized section uses the code of the last example.

Setup. To assist the user in finding the desired adjustments of the labels of typog provides macros that help setting up lowercaselabelitemadjustments and uppercaselabelitemadjustments. Their intended uses are in the draft phase of a document or in non-printed sections of the text.

The macros assume a \rightarrow correct height that they derive from the measured height of a sample text scaled by a user-defined factor, which defaults to $\frac{1}{2}$. The

¹⁷ The default factor of .5 hearkens back to STRIZVER'S suggestion that »[b]ullets should be centered on either the cap height or x-height of the neighboring text,« [24, p. 220].

then correct height gets indicated by a thin horizontal line parallel to the baseline. Thus, at sufficiently high magnifications it is possible to judge whether a label gets typeset too high or too low with respect to this reference line.

Note

The macros use the actual height of a given sample text. So, a lowercase sample should not contain any letters with ascenders.

Swashes whether upper- or lowercase always need special attention.

\typogadjuststairs SINCE V0.4 To get a quick overview how the four itemize labels align vertically \typogadjuststairs draws them at user-defined steps, typically $\frac{1}{4}$ pt, $\frac{1}{3}$ pt, or $\frac{1}{2}$ pt. It ignores any existing adjustments and in that way can be utilized as a first configuration step or, for a small $\langle step\text{-}size \rangle$ and a high $\langle number\text{-}of\text{-}steps \rangle$, for an easy refinement.

Generate stairs of $\langle number-of\text{-}steps \rangle$ vertically shifted label items; use the next odd number, if $\langle number\text{-}of\text{-}steps \rangle$ is even. Draw a reference hairline at $\langle scale\text{-}factor \rangle$ times the height of $\langle sample \rangle$, where $\langle scale\text{-}factor \rangle$ defaults to .5. The stairs start at a vertical shift of

$$-\frac{\langle number\text{-}of\text{-}steps\rangle - 1}{2} \times \langle step\text{-}size\rangle$$

and repeat up

$$\frac{\langle number\text{-}of\text{-}steps\rangle - 1}{2} \times \langle step\text{-}size\rangle.$$

The central step – which is always surrounded by a bit more space – shows the neutral alignment, this is 0 pt. \typogadjuststairs never prints the contents of $\langle sample \rangle$.

Example

Play ball!

This is the result of \typogadjuststairs{.25pt}{9}{ABC} with the document's definitions of \labelitem $\langle N \rangle$. The fifth label item in each line is the uncorrected one.

\typoguppercaseadjustcheck \typoglowercaseadjustcheck BOTH SINCE VO.4 For a quick and easy check how the four label items vertically align as configured use \typoguppercaseadjustcheck and \typoglowercaseadjustcheck. Experienced users with a keen eye for type can apply these

macros even in the initial setup. An accurate determination of uppercase-labelitemadjustments and lowercaselabelitemadjustments is preferably done at a high magnification (400% to 600% on a 100 dpi screen) with a representative sample of initial letters.

```
\typoguppercaseadjustcheck[\langle scale-factor\rangle=.5]\{\langle sample\rangle\}\\ \typoglowercaseadjustcheck[\langle scale-factor\rangle=.5]\{\langle sample\rangle\}\\
```

Typeset all four label items adjusted for uppercase or for lowercase with an indicator line at $\langle scale\text{-}factor \rangle$ times the $\langle sample \rangle$'s actual height. The default $\langle scale\text{-}factor \rangle$ is .5. Both macros refer to the currently configured values for the uppercase or lowercase adjustments but they are independent of any settings done with \uppercaseadjustlabelitems, \lowercaseadjustlabelitems, or \noadjustlabelitems. Again, $\langle sample \rangle$ does not get printed.

Example

```
Uppercase check with \typoguppercaseadjustcheck{ABCXYZ}:

ABGH•-*-QWYZ, 0123•-*-4567

and similarly for lowercase: \typoglowercaseadjustcheck{acexyz}:

ace•-*-mno, bdf•-*-gjy, 0123•-*-4567,

where we have bracketed the macro calls with selected uppercase and lowercase letters, or suitable figures.
```

In Table 4 on p. 26 we collected some suggestions for adjustment values in the *default* case when the label items are not redefined by the user and expand like

They display as $[\cdot]$, [-], $[\star]$, and $[\cdot]$, respectively.

3.9 Align Last Line of a Paragraph

The usual algorithms of LATEX typeset the last line of a paragraph flush with the left margin unless center, raggedleft or Centering, FlushRight (package ragged2e [22]) are in effect. For an instructive discussion consult Ch. 17, »Paragraph End«, of Ref. 11. The following environments adjust the last lines of paragraphs in different ways.

The environment lastlineraggedleftpar adjusts the various skips such that the last lines of the paragraphs gets typeset flush with the right margin.

```
\begin{lastlineraggedleftpar}
...
\end{lastlineraggedleftpar}
lastlineflushrightpar (alias)
```

lastlineraggedleftpar (env.) lastlineflushrightpar (env.)

TABLE 4: Some suggested values for the vertical adjustments of label items. The table assumes that the default definitions (of class article) for $\lobel{labelitem} \langle N \rangle$ are in effect. The itemize-list levels i, ii, iii and iv are referred to with N=1,2,3,4. All lengths are given as printer points (pt) and refer to a document font size of 10 pt.

Font Name	Uppercase Adjustments				Lo	Lowercase Adjustments

^{*} EDWARD TUFTE's Bembo in package ETbb. Note the two initial capital letters in the filename

letters in the filename. † Found in package XCharter. Again note the two initial capitals in the filename.

[‡] In package kpfonts.

[§] Contained in package mathpazo.

Utopia is available through package fourier or package mathdesign. In the latter case pass option adobe-utopia to the package.

The name lastlineflushrightpar is an alias for lastlineragged-leftpar.

lastlinecenteredpar (env.)

Center the last lines of the paragraphs enclosed by this environment. 18

```
\begin{lastlinecenteredpar}
...
\end{lastlinecenteredpar}
```

Use Cases

lastlineflushrightpar: Narrow, justified parts of the text put flush against the right margin. ¶ lastlinecenteredpar: Table or figure captions typeset justified as centered boxes. ■

3.10 Fill Last Line of a Paragraph

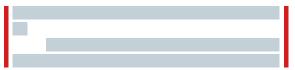

The problem of when and how to still the last line of a paragraph is quite intricate. We first define the problem then we proceed to general purpose functions and we close the section with specific environments to control the length of the last line.

3.10.1 Problem Definition

Depending on the value of \parindent, either zero or nonzero, there may be the need to control the length of the last line of a paragraph.

1. $\parindent > 0 [30, O1]$

If the last line of a paragraph is shorter than the \parindent of the following paragraph a visual gap tears open.

The same problem arises with displayed math in a flush-left¹⁹ setting, e.g., amsmath [2] and option fleqn.²⁰

A possible remedy is to reflow the paragraph in a way that its last line is clearly wider than \parindent; a typical suggestion being twice the \parindent.

¹⁸ Also compare the approach taken in Ref. 30.

¹⁹ The common practice of centering displayed equations does not call for the manipulations of a paragraph's last line discussed here.

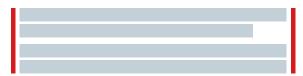

²⁰ For displayed equations and amsmath the relevant parameter is \mathindent.

2. $\parindent = 0 [30, O2]$

If the last line of a paragraph is completely filled with text, i. e., flush with the right margin, it may become hard to spot the start of the following paragraph unless \parskip is large.²¹

A possible, more legible solution is to reformat the paragraph in a way such that its last line leaves a marked gap with respect to the right margin.

The suggestions for the gap-width vary from two em to twice the width of a >typical \parindent²² for the gap [8].

Tip

In theory both problems, O1 and O2 can be resolved by either shortening or prolonging the last line of the paragraph. For the concrete case it is up to the user to decide which direction to go and to choose the method that yields the most pleasing typographic results.

TEX always considers the paragraph in its entirety. Thus any change the user demands »just for the last line« will permeate the whole paragraph and in unfortunate cases botch it.

Prudent users check the appearance of the problematic, original paragraph against one or more corrected versions of it – at least visually. Quantitative comparisons can be performed with the help of \tracingparagraphs.

Important

For the techniques in the following two subsections to work the paragraphs treated with them should have certain advantageous properties.

- Technically, the paragraphs need to contain enough glue (see for example Sec. 3.13) to achieve a low badness such that the desired paragraph end is deemed feasible by T_FX.
- Aesthetically, the paragraphs must be long enough to absorb the change in last-line fill level otherwise their gray-values visibly deviate from the average.
- 21 Package parskip defines \parskip as 6 pt plus 2 pt for a base size of 10 pt.
- 22 For example, LATEX's class article uses a \parindent of 25 pt.

This itemize list demonstrates vertically adjusted label items (Sec. 3.8).

3.10.2 Manual Changes

Most O1 or O2 situations can be navigated with do-it-yourself methods. Here are some common recipes.

- 1. End-of-paragraph intervention.
 - (a) Tie ~

Tie the last words.

The problem with the tie may be a hyphenation of one of the words that participates in the tie. The next item avoids this disadvantage.

(b) \mbox

Join the last words or inline equation at the end of the paragraph with an \mbox.

(c) \linebreak

Add a \linebreak to the back part of the paragraph (approximately where the \mbox of item 1b would start) in a way that the last line receives the desired length [32]. In turn the next-to-last lines may become unsightly. Counteract this degradation e.g. with recipes 2a to 2c.

Tying and \mboxing lend themselves to generalizations. We need not only tie at end of a paragraph but fuse logical units of sentences or inline equations so that the relevant information literally stays in the reader's focus. Cementing together text of course finds an end when overfull lines start to show up.

- 2. Uniform paragraph change.
 - (a) Vary spacing.

Modify the inter-word spacing, for example, with the macros introduced in Sec. 3.11.1.

Enclose the paragraph in either loosespacing or tightspacing. Increase the spacing $\langle level \rangle$ until the last line gets the desired length.

(b) Vary font tracking.

Enclose the paragraph in a setfonttracking group. See Sec. 3.12.1. Increase or decrease the tracking in steps of $\frac{1}{1000}$ em until the last line looks good.

(c) Vary font expansion.

Enclose the paragraph in a setfontexpand group. See Sec. 3.12.2.

- 3. A combination of any of the above items.
- 4. Some curveballs.
 - (a) If the paragraph already suffers from one of the problems that TEX addresses with \doublehyphendemerits, \finalhyphendemerits, or \adjdemerits, crank up one or all of these values to 10000 and observe whether the length of last line changes in the desired direction.
 - (b) If any influential microtype features have been enabled try with one more more of them *disabled*. See, e.g., environment nofontexpansion in Sec. 3.12.2.

3.10.3 **Multi-Purpose Environments**

shortenpar (env.) prolongpar (env.) The two environments shortenpar and prolongpar can be employed in quite general situations when a paragraph should be typeset one line longer or shorter, e.g., to avoid a widow line²³ or a club line²⁴ [14, p. 104 and 18]. (See also Sec. 3.14 for special functions to avoid clubs or widows.) >Accidentally<, they also change the length of the last line of the paragraph.

```
\begin{shortenpar} ... \end{shortenpar}
```

Environment shortenpar decreases the \looseness of the paragraph. 25 It performs well if the last line of the paragraph is short or the whole paragraph is loose.

```
\begin{prolongpar} ... \end{prolongpar}
```

This environment increases the \looseness of the paragraph, which is why it works best with decent or tight last lines that are almost full.

3.10.4 Specialized Environments

We introduce environments not just skips to get the correct behavior - set up all paragraph parameters before the paragraph ends - and, at the same time, limit the range of this parameter change.

covernextindentpar

Environment covernextindentpar can be helpful for case O1, i.e., a too short last line.

```
\begin{covernextindentpar} [\langle dim \rangle]
\end{covernextindentpar}
```

The environment asks TEX to extend the last line of a paragraph such that it takes at least $2 \neq 1$ indent (if \parindent $\neq 0$), 2em (if \parindent = 0), or $\langle dim \rangle$ if called with an optional argument.

The next environment, openlastlinepar, takes care of case O2, i. e., a last line in a paragraph that is almost full or completely filled.

```
\begin{openlastlinepar} [\langle dim \rangle]
\end{openlastlinepar}
```

- 23 The last line of a paragraph becomes a >widow((ger. Hurenkind) if it starts the following page or
- The first line of a paragraph is called 'club' or 'orphan' (ger. Schusterjunge) if it appears at the bottom of the page or column.
- Command \looseness is a T_FX primitive [14, p. 103n]. A thorough discussion of the interaction of \linepenalty and \looseness can be found in Ref. 29.

(env.)

openlastlinepar (env.)

It may resolve case O2 as it attempts to prevent a completely filled line by introducing a partly unshrinkable \parfillskip. Without optional argument the threshold of unused last-line length is either 2\parindent (if \parindent \neq 0) or 2em (if \parindent = 0). The optional argument $\langle dim \rangle$ directly sets the gap threshold.

Note that the application of this environment can be successful, this is, a completely filled last line is avoided, but the result may be of type O1 nonetheless.

3.11 Spacing

90% of design is typography.

And the other 90% is whitespace.

— JEFFREY ZELDMAN

The functions described in this section rely only on plain LATEX. No extra packages are required. Compare to the microtype-based functionality of Sec. 3.12.

3.11.1 Looser or Tighter Spacing

Never try to adjust lines by squeezing or stretching the tracking.

Go for the subtle solution: adjust word spacing instead.

— JAN MIDDENDORP [17, p. 119]

The environments in this section directly influence the spacing, this is, they change the width and stretchability of the horizontal space.

They at the one hand act gently by adjusting the spacing only by a small amount. On the other hand they operate decidedly in controlling the glue associated with the adjusted space. The latter also being important to ensure the monotonicity of the different $\langle level \rangle$ s. However, the strictly managed stretchability/shrinkability may lead to many overfull boxes with \fussy or when applied to short lines.

Environments loosespacing and tightspacing introduce four $\langle level \rangle$ s of >looseness< or >tightness<, where $\langle level \rangle = 0$ disables the functionalities. The higher the $\langle level \rangle$ the looser or tighter the text will by typeset, respectively.

```
\begin{lossespacing}[\langle \mathit{level} \rangle] \dots \\ lossespacing}
```

Environment loosespacing increases the width of a space by the percentages given in the Tab. 5.

The default level of loosespacing is 1.

```
\verb|\begin{tightspacing}| [\langle \textit{level} \rangle] \dots \\ \verb|\end{tightspacing}|
```

Environment tightspacing decreases the width of a space by the percentages given in Tab. 6.

The default level of tightspacing is 1.

loosespacing (env.)
tightspacing (env.)

⟨level⟩	Adjustment %	Note
0	n/a	neutral
1	+5	default
2	+10	
3	+20	
≥ 4	+30	

TABLE 5: Adjustments made by environment loosespacing to \spaceskip. The mapping of $\langle level \rangle$ to the exact skip definitions are $1 \mapsto 1.05^{+.5}_{-.1}$, $2 \mapsto 1.1^{+.5}_{-.1}$, $3 \mapsto 1.2^{+.6}_{-.2}$, and $\geq 4 \mapsto 1.3^{+.8}_{-.3}$, where all factors scale with \dimen2, the current font's space-width.

$\langle level \rangle$	Adjustment %	Note
	n/a	neutral
1	-1.25	default
2	-2.5	
3	-5	
≥ 4	-10	

TABLE 6: Adjustments made by environment tightspacing to \spaceskip. The mapping of $\langle level \rangle$ to the exact skip definitions are $1 \mapsto .9875^{+.0125}_{-.5}$, $2 \mapsto .975^{+.025}_{-.5}$, $3 \mapsto .95^{+.05}_{-.5}$, and $\geq 4 \mapsto .9^{+.1}_{-.5}$, where all factors scale with \dimen2, the current font's space-width.

Note

At a given $\langle level \rangle$ the changes of loosespacing are much larger than those of tightspacing.

Use Cases

Nudge line breaks or hyphenation points. ¶ Separate clashing descenders and ascenders. ¶ Eliminate rivers. ■

3.11.2 Wide Space

The \widespace macro and its companion \narrowspace derive their appearances from several of the current font's \fontdimen $\langle number \rangle$ s. T_EX addresses the latter by integers, which is totally non-memnonic. Therefore, we play softball by first presenting Tab. 7 that associates the \fontdimen $\langle number \rangle$ s with their meanings and also reports on their current values (for this document).²⁶

Typeset a wide, sentence-ending space as if in \nonfrenchspacing mode. Consult Table 8 for a comparison of the various sizes.

\widespace
\widespace*

STARRED FORM SINCE V0.2

\widespace
\widespace*

The unstarred macro \widespace inserts a space that is as wide as the font's sentence-ending space in \nonfrenchspacing mode, this is

 \footstart \footstart footstart \widespacestrength \times \footstart footstart footstart.

The association is given in Appendix F (p. 433) of Ref. 14. For a concise and understandable explanation of the T_FX \ fontdimen parameters consult Ref. 9.

#	Description	Value
1	Slant per 1 pt height	0
2	Interword space width	23.3
3	Interword stretch	11.6
4	Interword shrink	7.8
5	ˈx height	47.5
6	height	100
7	Extra space width	3.9

Table 7: All T_EX font parameters normalized to the font's quad-size. The first column # states the index of the \font-dimen parameter: $\langle number \rangle$. Column 2 presents short descriptions of \font-dimen $\langle number \rangle$. As examples, the values for the current font are shown in column 3.

The sentence that ends with >1.c uses \widespace after the period.

Its width is independent of any \frenchspacing or \nonfrenchspacing settings, but depends on \widespacestrength which defaults to 1. The latter can be overridden by the user to get a more or less pronounced effect.

If \fontdimen7 happens to be zero \widespace uses

\widespacescale \times \fontdimen2

as width instead, where \widespacescale defaults to 1.125. The stretchability and shrinkability of \widespace always are scaled with \widespacescale. The \widespacescale too can be redefined by the user to achieve different effects.

The starred form, $\widespace*$, unconditionally uses the $\final form = 0$ code-path.

Use Case

Useful as a sentence-ending space if, for example, the sentence ends in an abbreviation with a period or decimal number without trailing digits *and* the next sentence should be delimited in a clearer way. ¶ Open tight lines with a series of \widespaces.²⁷

3.11.3 Narrow Space

\narrowspace \narrowspace* SINCE V0.2

Typeset a narrow space. Consult Table 8 for a comparison of the various sizes.

\narrowspace
\narrowspace*

The unstarred macro \narrowspace inserts a narrow space with the width

 $\fontdimen2 - \narrowspacestrength \times \fontdimen7$

if \fontdimen7 is different from zero or otherwise

 $\normalfont{\nor$

The starred version, \narrowspace*, unconditionally uses the \fontdimen7 =

27 See also »Investigating the badness of a paragraph« on Page 9.

0 code-path. Refer to Table 7 for the meanings of the various \fontdimen parameters.

The stretchability and shrinkability of \narrowspace always get scaled with \narrowspacescale. Both factors, \narrowspacestrength and \narrowspacescale can be redefined by the user; their defaults are .5 and .9375, respectively.

Use Case

Tighten loose lines with a series of \narrowspaces. 28

TABLE 8: Exemplary comparison of standard \space versus \narrow-space and \widespace. All values are relative to the size of the current font's quad-size and shown as a percentage of it. \narrowspace and \widespace use the package's defaults. \P The upper values in the >Width< column for \narrowspace and \widespace refer to the \fontdimen7 $\neq 0$ case and the lower ones to the \fontdimen7 = 0 code-path.

Macro	Width	Stretch	Shrink
\narrowspace	21.4 21.8	10.9	7.3
\space	23.3	11.6	7.8
\widespace	27.2 26.2	13.1	8.7

3.12 Microtype Front-End

The functionalities are just front-ends of selected macros in package microtype – welcome syntactic sugar.

Important

All macros and environments introduced in this section require that package microtype [21] has been loaded, preferably *before* package typog

```
\label{lem:cotype-options} $$ \usepackage[\langle typog-options \rangle...]{typog} $$ in the document preamble.
```

28 Footnote 27 again applies.

3.12.1 Tracking

Caution

The tracking changes may interfere with implicit changes of tracking declared with \SetTracking. Explicit calls to \textls remain in effect.

setfonttracking (env.)

Override the default tracking for all fonts.

```
\begin{setfonttracking}{\langle delta\rangle}
...
\end{setfonttracking}
```

The environment setfonttracking manages a group for \lsstyle of package microtype. The change $\langle delta \rangle$ in tracking is given as multiples of $\frac{1}{1000}$ em. Positive as well as negative values of $\langle delta \rangle$ are allowed.

See Sec. 5.3, Tracking, and 7, Letterspacing revisited, in the documentation of microtype [21] for a detailed explanation.

For font combinations involving monospaced fonts ($T_{E}X$ lingo: typewriter) an overly large spacing may show up at the borders where fonts change. This is caused by the calculation of the »outer spacing« described in Sec. 5.3 of the microtype manual.

Use configuration variable trackingttspacing to reduce the outer spacing to a reasonable value either directly at package-load time

\usepackage[trackingttspacing={250, 75, 50}]{typog}
or with the help of \typogsetup in the document *preamble* (after loading microtype and typog)

```
\typogsetup{trackingttspacing={250, 75, 50}}
```

If the argument of option tracking ttspacing is omitted the outer spacing defaults to 300, 90, 60.

Use Cases

Nudge line breaks or hyphenation points. ¶ Avoid clashes of descenders and ascenders, e.g., for \smashed symbols of inline math. – Think of integrals. ¶ Control the length of the last line in a paragraph. ■

3.12.2 Font Expansion

setfontshrink (env.) setfontstretch (env.)

Adjust the limits of either only stretchability or only shrinkability and zero the other component, i. e., shrinkability and stretchability, respectively.

A $\langle level \rangle$ of zero is a no-op. Tables 9 and 10 summarize the values for stretch and shrink in these environments.

The three (nonzero) shrink limits of setfontshrink can be configured with package option shrinklimits and – in the same way – the three (nonzero) stretch limits of setfontstretch with package option stretchlimits.

$\langle level \rangle$	stretch	shrink	Note
0	n/a	n/a	no operation
1	0	5	default
2	0	10	
3	0	20	

TABLE 9: Preconfigured val-
ues for shrink inside of envi-
ronment setfontshrink as
1/1000 em. Note that all stretch
values are zero, so the fonts only
can shrink.

stretch	shrink	
n/a	n/a	no operation
5	0	default
10	0	
20	0	
	n/a 5 10	5 0 10 0

TABLE 10: Preconfigured values for stretch inside of environment setfontstretch as ½1000 em. Note that all shrink values are zero, so the fonts only can stretch.

Use Cases

Nudge line breaks or hyphenation points. ¶ Control the length of the last line in a paragraph. ■

setfontexpand (env.)

Manipulate both, stretch and shrink values at the same time.

 $\verb|\begin{setfontexpand}| [\langle \textit{level} \rangle] \dots \\ \verb|\end{setfontexpand}|$

Table 11 gives an overview of the values associated with \(\lambda \text{level}\rangle\).

$\langle level \rangle$	stretch	shrink	Note
0	n/a	n/a	no operation
1	5	5	default
2	10	10	
3	20	20	

TABLE 11: Preconfigured values for shrink and stretch inside of environment setfont-expand as ½1000 em. Note that both shrink and stretch values are nonzero, so the fonts can shrink or expand.

The six shrink and stretch limits of setfontexpand can be configured with package options shrinklimits and stretchlimits.

Notes

- Environment setfontexpand shares its shrinklimits with setfontshrink and its stretchlimits with setfontstretch.
- These environments do not nail down any font's expansion but only set up its available range. See Sec. 3.3, »Font Expansion«, in the microtype documentation [21].

Moreover, a text may not respond neither to setfontshrink, setfontstretch, nor setfontexpand because TEX already considers it optimal without expansion or within the previous expansion limits, e.g., those set at microtype load time as opposed to typog's load time.

Use Cases

Nudge line breaks or hyphenation points. ¶ Control the length of a paragraph, e. g., to avoid a widow. ■

nofontexpansion (env.)

Disable the microtype feature >expansion< inside of the environment.

```
\begin{nofontexpansion} ... \end{nofontexpansion} nofontexpand (alias)
```

The name no font expand is an alias for no font expansion.

Use Cases

Nudge line breaks or hyphenation points. ¶ Prevent severe scaling effects in paragraphs strongly manipulated by other means, e.g., shortenpar or prolongpar. ■

3.12.3 Character Protrusion

nocharprotrusion (env.)

\slightlysloppy

(env.)

slightlysloppypar

Disable the microtype feature >protrusion< inside of the environment.

```
\begin{nocharprotrusion} ... \end{nocharprotrusion}
```

Use Cases

Table of Contents or similar tables with aligned section numbers. ¶ Any table with left-or right-aligned numerals in particular tabular numerals. ¶ Index. ■

3.13 Sloppy Paragraphs

Experienced LATEX users know that \sloppy is more of a problem by itself and not really a viable solution of the »overfull box« syndrome.

We define the macro \slightlysloppy and the associated environment, slightlysloppypar, with a user-selectable $\langle sloppiness \rangle$ parameter. The constructions recover the known settings \fussy ($\langle sloppiness \rangle = 0$) and \sloppy ($\langle sloppiness \rangle \geq 8$), and introduce seven intermediate $\langle sloppiness \rangle$ levels.²⁹ The default $\langle sloppiness \rangle$ is 1.

```
\slightlysloppy[\langle sloppiness \rangle]
\begin{slightlysloppypar}[\langle sloppiness \rangle]
...
\end{slightlysloppypar}
```

Table 12 summarizes the adjustments that \slightlysloppy makes depending on the \(sloppiness \) level.

Environment slightlysloppypar[(sloppiness)] mimics IATEX's sloppypar, while offering the flexibility of \slightlysloppy.

²⁹ Also compare the findings for \emergencystretch in Ref. 28.

TABLE 12: Adjustments made by \slightlysloppy to various TEX parameters at different levels of (sloppiness).

⟨sloppiness⟩	\toler- ance	\hfuzz \vfuzz	\emergency- stretch <i>G</i>	Note
		pt	em	
0	200	.1	0	T _E X:\fussy
1	330^{\dagger}	.15	.375 [‡]	default
2	530^{\dagger}	.2	.75 [‡]	
3	870 [†]	.25	1.125^{\ddagger}	
4	1410^{\dagger}	.3	1.5^{\ddagger}	
5	2310^{\dagger}	.35	1.875 [‡]	
6	3760 [†]	.4	2.25 [‡]	
7	6130^{\dagger}	.45	2.625 [‡]	
≥ 8	9999	. 5	3	TEX:\sloppy

$$\label{eq:continuous} \\ \mbox{\em emergency stretch} = G \times \frac{\mbox{\em linewidth}}{\mbox{\em textwidth}}.$$

to prevent excessive stretchability in narrow lines.

 $^{^{\}dagger}$ All intermediate levels set \pretolerance = \tolerance/2. ‡ The intermediate levels scale the amount of available glue G (indicated in column 4 of the table) for \emergencystretch with the actual line length, this means, in these levels

Use Cases

Drop-in replacement for \sloppy, whether explicit or implicit (think of \parbox). ¶ Initial paragraphs in theorem environments (e.g., as defined by amsmath or amsthm), where the theorem head already takes a lot of space. ¶ Bibliographies as environment thebibliography sets \sloppy.

3.14 Vertically Partially-Tied Paragraphs

IAT_EX provides several macros and environments to tie material vertically – most prominently samepage and minipage. 30 Typog's macros and environments constitute more sophisticated but weaker forms of these. They tie only the first or last couple of lines in a paragraph while the rest of the paragraph gets broken into pages by T_EX in the usual way.

The macros and environments described in this section locally set ε -TeX penalty arrays [6, Sec. 3.8]. In addition the environments vtietoppar, vtiebot-par, and vtiebotdisptoppar explicitly issue a \par at the end of the group.

Avoid a club line in each partial paragraph.

\vtietop
vtietoppar (env.)

```
\vtietop[\langle number-of-lines \rangle]
\begin{vtietoppar}[\langle number-of-lines \rangle] ... \end{vtietoppar}
```

Vertically tie the first $\langle number-of-lines \rangle$ in a paragraph. Zero or one for $\langle number-of-lines \rangle$ are no-ops. Up to nine lines can be fused. The default is to link three lines.

Use Cases

String together the first paragraph right after a sectioning command. ¶ Tie the first line of an itemized, enumerated, or a description list with the paragraph following \item.

\splicevtietop

Inside of a list a one-off solution simply concatenates \item[...]\vtietop to fuse the line with the item#, the representation of the enum#, or the description term with the first paragraph. For a systematic use prefer \splicevtietop and apply it as the first thing in the list body.

```
\splicevtietop[\langle number-of-lines \rangle]
```

Use this macro *inside* of a list-like environment to equip each \item with \vtietop[$\langle number-of-lines \rangle$]. The default $\langle number-of-lines \rangle$ is three as for any of the vtie... functions.

```
Example for a description list and plain LATeX:

\begin{description}
\splicevtietop[2]
\item[...]
\end{description}
```

Alternatively with package enumitem [4]:

³⁰ A valuable complement to these is package needspace [36] which takes a different approach and reliably works in *mixed* horizontal and vertical mode situations.

```
\begin{description}[first=\splicevtietop[2]]
     \item[...]
\end{description}
```

or shorter and with the default $\langle number-of-lines \rangle$, 3, using the enumitem style³¹ vtietop:

vtietop (enumitem key)

```
\usepackage{enumitem}
\begin{description}[vtietop]
  \item[...]
\end{description}
```

\vtiebot

Avoid a widow line in each partial paragraph.

```
vtiebotpar(env.)
```

```
\vtiebot[\langle number-of-lines \rangle]
\begin{vtiebotpar}[\langle number-of-lines \rangle] ... \end{vtiebotpar}
```

vtiebotdisp(env.)

Vertically tie the last $\langle number-of-lines \rangle$ in a paragraph. Zero or one for $\langle number-of-lines \rangle$ are no-ops. Up to nine lines can be fused. The default is to link three lines. Avoid a display widow line in each partial paragraph.

```
\beginvtiebotdisp[\langle before-disp-number-of-lines\rangle]
...
\end{vtiebotdisp}
```

Vertically tie the last $\langle before-disp-number-of-lines \rangle$ in a paragraph before a display. Zero or one for $\langle before-disp-number-of-lines \rangle$ are no-ops. Up to nine lines can be fused. The default is to link three lines.

To use the function bracket the paragraph before the display (the one that needs protection) and the associated displayed math:

vtiebotdisptoppar (env.)

Avoid a display widow, compound the display with its preceding *and* following paragraph, and avoid a club line in the paragraph right after the display.

```
\begin{vtiebotdisptoppar}[\langle before-disp-number-of-lines\rangle]
\[ \langle after-disp-number-of-lines\rangle]
\[ \langle end{vtiebotdisptoppar}
```

³¹ The documentation of enumitem prosaically calls them >keys< (Section 3) not >styles<.

Vertically tie the last $\langle before\text{-}disp\text{-}number\text{-}of\text{-}lines \rangle$ in the paragraph before a display and the first $\langle after\text{-}disp\text{-}number\text{-}of\text{-}lines \rangle$ in the paragraph after the display. Moreover, turn the paragraphs and the display into an un-breakable unit.³²

Zero or one for $\langle before-disp-number-of-lines \rangle$ as well as $\langle after-disp-number-of-lines \rangle$ are no-ops for the respective paragraph. Up to nine lines each can be fused.

Both optional arguments default to three. If only the first argument is given the second acquires the same value.

```
To use the function bracket the paragraphs before and after the display:

\begin{vtiebotdisptoppar}

% vertically tied paragraph before the math display
\begin{equation}

% math
\end{equation}

% vertically tied paragraph after the math display
\end{vtiebotdisptoppar}
```

See also Sec. 3.10.3 for other methods to avoid club or widow lines.

Partial Paragraphs And Counting Lines. The top-of-paragraph ties, \vtietop and vtietoppar count \(number-of-lines \) from the beginning of every partial paragraph. Each displayed math in the paragraph resets the count. The bottom-paragraph ties, \vtiebot, vtiebotpar, \vtiebotdisp, and vtiebotdisp-par count backward from the end of each partial paragraph. Again, each displayed math in the paragraph resets the count. According to TeX's rules, a displayed math formula always is counted as three lines no matter its contents. Table 13 summarizes these rules with the help of an example.

Tips

- The environments can be combined to arrive at paragraphs that simultaneously are protected against club lines and (display) widow lines.
- For very long derivations that are not interrupted and thus made breakable with the help of \intertext³³ or \shortintertext³⁴ it is desirable to make the display breakable. This is achieved with \allowdisplaybreaks or the environment breakabledisplay which will be described in Sec. 3.15.

Use Cases

Fix widows and orphans, e. g., those turned up by package widows-and-orphans [19]. ¶ Extend the typographic convention of »three to four lines instead of a single club or widow line« to a context-dependent number of lines that tries to keep all (well, dream on) the information together the reader needs at that particular point. ■

³² The paragraphs and the display are concreted together by setting both \predisplaypenalty and \postdisplaypenalty to 10000.

³³ Introduced in package amsmath [2].

³⁴ Defined in package mathtools [12].

Example	\vtietop [†]	\vtiebot [‡]
Contents	Count	Count
Text line ₁	1	3
Text line ₂	2	2
Text line ₃	3	1
)		
Display		
) main		
Text line ₄	1	2
Text line ₅	2	1
	Contents Text line ₁ Text line ₂ Text line ₃ Display math Text line ₄	$ \begin{array}{c cccc} Contents & Count \\ \hline Text line_1 & 1 \\ Text line_2 & 2 \\ Text line_3 & 3 \\ \hline Display \\ math \\ \hline Text line_4 & 1 \\ \hline \end{array} $

Table 13: Exemplary, eight-line paragraph compounded of two partial paragraphs of three and two lines and a displayed math formula of arbitrary size sandwiched in between.

3.15 Breakable Displayed Equations

breakabledisplay (env.)

Package amsmath offers \allowdisplaybreaks to render displayed equations breakable at each of their lines. Environment \breakabledisplay is a wrapper around it which limits the macro's influence to the environment. Furthermore, the default \langle level \rangle of breakabledisplay is 3 whereas that of \allowdisplaybreaks is 4. This makes breakabledisplay less eager to break a displayed equation and thus better suited to full automation of the page-breaking process.

```
\begin{breakabledisplay}[\langle level \rangle] ...
\end{breakabledisplay}
```

Environment breakabledisplay simply passes on $\langle level \rangle$ to \allowdisplaybreaks. Table 14 shows the default penalties that amsmath associated with each of the $\langle level \rangle$ s.

Tips

- Terminating a line with * inhibits a break after this line.
- A \displaybreak[\langle level \rangle] can be set for each line of the displayed equation separately. LATEX resumes with the original value of \interdisplaylinepenalty in the following lines.
- If a discretionary break of the displayed equation is to be accompanied with some aid for the reader, team \intertext(or \shortintertext) with \displaybreak as, e.g.,

[†] This is ε -TEX's counting scheme of \clubpenalties; it also holds for vtietoppar.

[‡] The same counting scheme also holds for vtiebotpar, \vtiebot-disp, and vtiebotdisppar. It is implied by ε -T_EX's line counts of \widowpenalties and \displaywidowpenalties on which the functions of this package are based.

TABLE 14: Penalties \interdisplaylinepenalty associated with different \(\left\) environment breakabledisplay. Depending on the version of package amsmath the actual penalties may differ.

$\langle level \rangle$	\interdisplay-	Note
	linepenalty	
0	10000	no operation
1	9999	
2	6999	
3	2999	default
4	0^{\dagger}	

[†] This is the default of \allowdisplaybreaks.

```
\newcommand*{\discretionarydisplaybreak}
  {\intertext{\hfill Eq.~cont.~on next page.}%
  \displaybreak
  \intertext{Eq.~cont.~from prev.~page.\hfill}}
```

Use Cases

Extremely long derivations without interspersed \intertext or \shortintertext. ¶ Draft phase of a document. ■

3.16 Setspace Front-End

In the copy of this document gets typeset with 10/12.5.

Package setspace [25] is a base hit when it comes to consistently setting the line skip for a document via the macro \setstretch. The interface of \setstretch though is unintuitive as it asks for an obscure factor. The LATEX user however prefers to keep her eyes on the ball and set the line skip directly (e. g. 12.5 pt) or the lines' leading to a length or percentage of the font's size. This is where the following macros go to bat.

Important

All macros that are introduced in this section rely on macro \setstretch. So package setspace must have been loaded with

\usepackage{setspace}

in the document preamble.

\setbaselineskip SINCE V0.3

Set the line skip using an absolute length – technically: a dimen.

$\sline \sline \sline$

Set the \baselineskip to $\langle baseline\text{-}skip \rangle$. This is what a non-initiated user expects from the assignment

\setlength{\baselineskip}{\daseline-skip\}

The \(\lambda baseline-skip\rangle\) can contain a rubber (stretch/shrink) component, however, \setbaselineskip will discard of it and issue a warning that only the fixed-length part will be used in the computation.

Example

• Let us assume we want to lighten the gray value of the copy a tad with the \baselineskip increased from 12 pt to 12.5 pt. To this end we say:

\setbaselineskip{12.5pt}

• In a generic part of the document, where the actual \baselineskip is not known, we can refer to its current value and rescale it:

\setbaselineskip{\baselineskip * 12.5 / 12}

Care should be taken if code like the above is implicitly or explicitly repeated, because it results in a geometric series.

\resetbaselineskip SINCE V0.3

Reset the \baselineskip to its original value.

\resetbaselineskip

This macro simply expands to \setstretch{1}. So, we rely on setspace's notion of what is a single-line \baselineskip.

\setbaselineskippercentage SINCE VO.3

Set the \baselineskip with a relative value calculated as a percentage of the current font's design size.

³⁵ To find out about the current font's size and the \baselineskip in printable form check out Sec. 3.2.1 on p. 6.

\setbaselineskippercentage{\langle baselineskip-percentage\range}

Set \baselineskip to \typogfontsize \times \(\langle \text{baselineskip-percentage} \rangle /100.

Example

We modify the previous example and assume a font design size of 10 pt, but now write

\setbaselineskippercentage{125}

which sets \baselineskip to $10 \text{ pt} \times 125/100 = 12.5 \text{ pt}$.

\setleading SINCE V0.3

Set the \baselineskip with an absolute length that gets *added to* \typogfontsize.

$\strut \$

Set the \baselineskip to \typogfontsize plus $\langle leading \rangle$. Note that $\langle leading \rangle$ can be negative, e.g. to set solid.

Example

Another solution of the previous example, given a font design size of 10 pt is to write

\setleading{2.5pt}

which sets $\begin{tabular}{l} baselineskip to 10pt + 2.5pt = 12.5pt. \\ \end{tabular}$

\setleadingpercentage SINCE V0.3

Set the \baselineskip to \typogfontsize *plus* a relative value calculated as a percentage of \typogfontsize.

\setleadingpercentage{\leading-percentage\}

Set \baselineskip to \typogfontsize \times (1 + $\langle leading\text{-}percentage \rangle / 100$).

Example

We modify the previous example and again assume a font design size of 10 pt, but now write

\setleadingpercentage{25}

which sets \baselineskip to $10 \text{ pt} \times (1 + 25/100) = 12.5 \text{ pt}$.

\typogfontsize (dimen) SINCE VO.3 The macros \setbaselineskippercentage, \setleading, and \setleadingpercentage all depend on the font size. By changing \typogfontsize they can be configured for different font sizes.

The length \typogfontsize gets initialized at the end of the preamble to the default font's quad size:³⁶

\typogfontsize=\fontdimen6\font

which is also called its »nominal size« or its »design size«. This assignment can be repeated at any point in the document to record a reference font's size. To set just \typogfontsize without changing the current font, encapsulate the font change in a group and export the new value:

```
\begingroup
  \usefont{T1}{Arvo-TLF}{m}{n}\selectfont
  \normalsize
  \global\typogfontsize=\fontdimen6\font
\endgroup
```

An alternative to relying on the design size is using the actual size of an uppercase letter:

```
\settoheight{\typogfontsize}{CEMNORSUVWXZ}
With \typogfontsize defined this way it becomes trivial to set solid:
\setleading{0pt}
```

or

\setleadingpercentage{0}

Tip

All macros in this section actually accept expressions of their respective argument types, though the sick rules of $T_EX \langle dimen \rangle$ - and $\langle skip \rangle$ -expressions apply.

Here are some forms that do work:

```
\setbaselineskip{12pt + 0.6667pt}
\setbaselineskip{12pt * 110 / 100}
\setbaselineskippercentage{100 + 25}
\setleading{1pt / -2.0}
\setleadingpercentage{10 - 25 / 2}
```

3.17 Smooth Ragged

The attention someone gives to what he or she makes is reflected in the end result, whether it is obvious or not.

— ERIK SPIEKERMANN

Package typog implements a novel approach to typeset ragged paragraphs. Instead of setting the glue inside of a paragraph to zero and letting the line-widths vary accordingly [31] we prescribe the line-widths with TEX's \parshape primitive and leave alone the stretchability or shrinkability of the glue.

Caution

None of the following environments work inside of lists.

We introduce three environments that set three, five, or seven different line-lengths (which TEX of course will repeat for paragraphs longer than three, five, or seven lines): smoothraggedrightshape-triplet, smoothraggedrightshapequintuplet, and smoothraggedrightshapeseptuplet; they work for paragraph lengths up to 99, 95, and 98 lines, respectively.

```
\label{thm:continuous} $$ \begin{array}{ll} \begin{smoothraggedrightshapetriplet} & (option)...] & (width1) & (width2) & (width3) & ... \\ & (option)...] & (width1) & (width1) & ... & (width5) & ... \\ & (option)...] & (width1) & ... & (width5) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (option)...] & (width1) & ... & (width7) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) & ... & (width1) & ... \\ & (width1) & ... & (width1) &
```

The environments take N = 3, 5, or 7 mandatory line-width parameters, where each $\langle widthI \rangle$, I = 1, ..., N is a skip, i. e., a dimen that can include some glue.

Options

leftskip=⟨*dim*⟩

Set the left margin for the smooth ragged paragraph to $\langle dim \rangle$. Similar to the TeX parameter \leftskip.

parindent= $\langle dim \rangle$

Set the first-line indent for the smooth ragged paragraph to $\langle dim \rangle$. Similar to the T_FX parameter \parindent.

 Environment smoothraggedrightpar builds upon the three generators. It typesets a single paragraph with a given $\langle ragwidth \rangle$ of the ragged, right margin, where the rag width is the length-difference of the longest and the shortest lines.

The line lengths equally divide the ragged margin, i. e., they are arithmetic means with respect to the generator size.

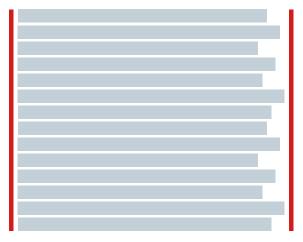

The triplet generator repeats a *short line – long line – middle-length line* sequence.
 Shown below are two complete cycles.

The quintuplet generator varies the theme of the triplets and avoids the >ladder
 of lines 2-3-4 (or, if numbered by cycle: 1.2-1.3-2.1) there. Shown here are two cycles.

— The septuplet generator uses a permutation that looks >random<. At least it hides the boundaries of cycles well. Shown here are two of them.</p>

smoothraggedright
 (env.)

Environment smoothraggedright is the multi-paragraph version of smooth-

raggedrightpar. It takes the same optional arguments.

```
\begin{smoothraggedright}[\langle option \rangle ...]
...
\end{smoothraggedright}
```

Options

linewidth= $\langle dim \rangle$

Override the length of the longest line. The default line-width is \line-width.

Global Parameters

$\space{-0.05cm} \space{-0.05cm} \space{-0.05$

The environment adds glue to every line-width³⁷ to achieve a more convincing »ragged appearance« and to reduce the number of overfull lines. The algorithm divides the smooth margin into 3, 5, or 7 parts depending on the chosen \smoothraggedrightgenerator (see below). The \smoothraggedrightfuzzfactor is the amount of glue of each line expressed as a multiple of the distance between the division points. The default of 1.0 means to add as much glue such that the lines just do not overlap (assuming justification is feasible).

\smoothraggedrightgenerator

Select a generator to use. Valid generator names:

- triplet,
- · quintuplet,
- septuplet.

The default generator is triplet.

\smoothraggedrightleftskip= $\langle dim \rangle$

Value for leftskip to pass to the generator. Default: 0 pt.

\smoothraggedrightparindent= $\langle dim \rangle$

Value for parindent to pass to the generator. Default: 0 pt.

\smoothraggedrightragwidth= $\langle dim \rangle$

Value for the width of the ragged right margin. Default: 2 em.

³⁷ The shortest line only gets stretchability, the longest only receives shrinkability. All other lines are both stretchable and shrinkable.

Throughout this manual we have demonstrated how smoothraggedright environments work for very narrow columns namely inside of the document's margins: all maginal notes were typeset inside of \smoothraggedright environments (quintuplet generator, 1.5 em rag width, at footnote size in addition using environments slightlysloppy and loosespacing). Here, we utilize it with the quintuplet generator and a rag-width of only 7.0pt in a paragraph that is 355.0pt wide and averages around twelve words per line. There is much more glue to adapt to the line-ends and thus the desired rag is archieved far easier. The sloppyness is minimal, this is, \fussy is in effect and character protrusion into the margins is switched off. A limitation of the current implementation is that it is ineffective inside of lists. Therefore, this paragraph has not been wrapped inside of an 'examples', because all examples are coded as lists.

Use Cases

Replacement for \RaggedRight [22]. ¶ Design alternative for fully justified paragraphs if used with a small rag-width.

Anticipated Changes & Possible Extensions

Translate the code to l3galley which is part of the l3experimental package [15]. Galley code is supposed to work inside of lists, too.

geometry

4 Other Packages for Fine LATEX Typography

Many other packages help with getting better output from IAT_EX. Here is a list – in alphabetical order – of the ones the author considers particularly valuable.

enumitem Flexible and consistent definition of all basic LAT_EX-list types plus inline lists [4].

Powerful and sophisticated setup of the page layout [26]. Best accompanied by layout [16] to visualize the page geometries.

hyphenat Hyphens that do not inhibit further auto-hyphenation of a compound word [34].

microtype Fine control of spacing, tracking, sidebearings, character protrusion into the margins, font expansion, and much more [21].

See Section 3.12 for a front-end to microtype offered by this package. See also KHIREVICH'S discussion [13].

ragged2e Improved versions of environments raggedleft, raggedright, and center [22].

setspace Consistently set the line-spacing of a document, i. e., control \base-lineskip [25].

See Section 3.16 for a front-end to setspace offered by this package.

53 A PACKAGE CODE

pog@register@pdfsubstitute We often need to register (simple) substitute commands suitable for PDF bookmarks. This is a convenient abbreviation for that task.

```
24 \newcommand {\typog@register@pdfsubstitute} [1] {%
   \AtBeginDocument{%
      \ifdefined\pdfstringdefDisableCommands
26
        \pdfstringdefDisableCommands{#1}%
27
      \fi}}
28
```

Some functionality depends on package microtype. To complicate matters for certain setup operations, e.g., \SetExpansion, microtype must be loaded before package typog, a fact that we encode in \iftypog@microtype@preloaded.

ftypog@microtype@preloaded

```
30 \newif\iftypog@microtype@preloaded
```

equire@preloaded@microtype It is easy to determine whether microtype has been sourced. We raise to the occasion and define a pair of check macros which simplify the test for the correct microtype load state.

```
32\ifdefined\MT@MT
   \typog@typeout{package microtype preloaded}%
   \typog@microtype@preloadedtrue
   \def\typog@require@preloaded@microtype{\relax}
35
36\else
   \typog@microtype@preloadedfalse
37
38
   \def\typog@require@preloaded@microtype
      {\PackageError{typog}%
39
                    {package microtype not (pre-)loaded}%
40
                    {package microtype must be loaded before pack-
41
 age typog}}
42\fi
43
```

\iftypog@microtype@loaded

```
44 \newif\iftypog@microtype@loaded
```

\typog@require@microtype This code duplicates \typog@require@preloaded@microtype; the only difference is that we call the test *after* the preamble was processed.

```
46 \AtBeginDocument{
   \ifdefined\MT@MT
47

A.2 Information

\typog@round@dim@to@tenths

```
135 \ExplSyntaxOn
136 \newcommand*{\typog@round@dim@to@tenths}[1]
137    {\fp_to_decimal:n {round(10 * \dim_to_fp:n{#1} / 1\p@) / 10}}
138 \ExplSyntaxOff
139
```

\typog@formatsizeinfo Arguments 1 and 2 are the font size and the line spacing. The third parameter adds (decorative) units to both numbers.

```
140 \newcommand*{\typog@formatsizeinfo}[3]
141 {#1#3\kernedslash #2#3}
142
```

\fontsizeinfo All macros defined inside of \fontsizeinfo must be global because the call can occur inside of a group.

The two \ede fs at the beginning capture the desired values at the point where the macro *is called*. The user-macro is tricky for we need a global macro with a constructed name and an associated starred version.

Implementation Note

\@ifstar caused too many problems which \@ifnextchar in combination with \@gobble avoid.

```
143 \NewDocumentCommand{\fontsizeinfo}{s m}
```

```
{\global\expandafter\edef\csname typog@fontsize@#2\endcsname

189 {\typeout{</typog-inspect>}%
190 \ignorespacesafterend}
```

typoginspectpar (env.) Companion environment to typoginspect which adds a \par before the end of the group.

A.3 Hyphenation

\typog@allowhyphenation Re-enable automatic hyphenation.

The same or almost the same implementation can be found in babel as macro \bbl@allowhyphens and hyphenat as macro \prw@zbreak.

\allowhyphenation Define a user-visible alias unless the name is already used.

```
203 \unless\ifdefined\allowhyphenation
204 \let\allowhyphenation=\typog@allowhyphenation
205 \fi
206
```

\breakpoint The starred form inhibits hyphenation of the right-hand component.

```
207 \NewDocumentCommand{\breakpoint}{s}
208 {\discretionary{}{}}%
209 \IfBooleanTF{#1}%
210 {\ignorespaces}%
211 {\typog@allowhyphenation}}
212
```

PDF-substitute definition

```
213 \typog@register@pdfsubstitute{
214 \def\breakpoint#1{\if*\detokenize{#1}\ignorespaces\fi}%
215 }
216
```

hyphenmin (*env.*) No trickery here. – We use the mandatory argument for the value of \lefthy-phenmin if the optional argument has been omitted.

```
217 \NewDocumentEnvironment{hyphenmin}{o m}
218 {\lefthyphenmin=\IfNoValueTF{#1}{#2}{#1}%
219 \righthyphenmin=#2}
220 {}
221
```

A.4 Disable/Break Ligatures

\typog@hyphen We define our own hyphen so the user can override the definition in a pinch.

```
222 \newcommand*{\typog@hyphen}{\char'-}
                                                     223

```

\rightkernedhyphen Apply kerning on the right-hand side of the hyphen only.

A.7 Raise Selected Characters

\typog@breakpoint We want our own penalty for a line-break at a particular point. The predefined \allowbreak is too eager. A package-private, user-configurable penalty fits best.

```
320 \newcommand*{\typog@breakpoint}
321 {\penalty\typog@config@breakpenalty}
```

\capitalhyphen Macro \capitalhyphen introduces a hyphenation possibility right after the dash, whereas the starred version does not.

The non-hyperref version's code is straightforward. The \pdfstringdef-DisableCommands version must be expandable and must match the other version's signature. Yikes! We exploit the fact that conditions are expandable. However, we cannot use \typog@hyphen in the expansion as \char gets in the way. So, we fall back to the least common denominator and use a bare dash.

```
327 \typog@register@pdfsubstitute{
328  \def\capitalhyphen#1{%
329   \if*\detokenize{#1}%
330    -\ignorespaces
331  \else
332   -#1%
333  \fi}
334 }
```

\capitalendash Macro \capitalendash introduces a hyphenation possibility right after the dash; its starred version does not.

```

516
              {\forcsvlist{\@typog@noadjust@labelitem}{#1}}%
517
518
     \ignorespaces}
519
```

Now we get to the dirty part. All the above definitions do not get called until we hack the existing itemize-environments, either the one of plain IATEX or the one modified by package enumitem.

Here comes the result of latexdef -c article -s itemize, which was used to derive the patch code:

```
%
     \def\itemize{%
%
       \ifnum \@itemdepth > \thr@@
%
         \@toodeep
       \else
%
         \advance\@itemdepth\@ne
%
         \edef\@itemitem{labelitem\romannumeral\the\@itemdepth}%
%
%
         \expandafter
```

```
% \list
% \csname\@itemitem\endcsname
% {\def\makelabel##1{\hss\llap{##1}}}%
% \fi}
```

\@typog@itemize@patch This is the additional code we inject into plain LATEX's or package enumitem's \itemize.

```
520 \newcommand*{\@typog@itemize@patch}
```

Save the original definition of \@itemitem for chain-calling it later on.

```
521 {\letcs{\@typog@old@itemitem}{\@itemitem}
```

Sneak in our own macro's name.

```
522 \edef\@itemitem{@typog@labelitem\romannumeral\the\@itemdepth}
```

Redefine under the original macro's name so that our code gets called and the old code (\@typog@old@itemitem) is expanded.

```
523 \expandafter\def\csname\@itemitem\endcsname
524 {\raisebox{\csname typog@adjust@labelitem\romannumeral\the\@itemdepth\endc
525 {\@typog@old@itemitem}}}
526
```

If package enumitem has been loaded, we use the *same* patch. Here comes the result of latexdef -c article -p enumitem -s enit@itemize@i that explains, why no change is required:

```
%
     \def\enit@itemize@i#1#2#3#4{%
       \ifnum #1 > #3 \relax
%
0%
         \enit@toodeep
%
       \else
%
         \enit@prelist\@ne{#1}{#2}%
%
         \edef\@itemitem{label#2\romannumeral#1}%
%
         \expandafter
         \enit@list
%
           \csname\@itemitem\endcsname
%
%
           {\let\enit@calc\z@
            \def\makelabel##1{\enit@align{\enit@format{##1}}}%
%
%
            \enit@preset{#2}{#1}{#4}%
%
            \enit@calcleft
%
            \enit@before
            \enit@negwidth}%
%
%
         \enit@keyfirst
%
       \fi}
```

\@typog@patch@itemize Unconditionally apply the patches that are just *single* macro calls to disturb the original macros as little as possible. If we detect enumitem to be present we modify its definition of itemize otherwise we wrestle LATEX's macro.

```
527\newcommand*{\@typog@patch@itemize}
528 {\ifdefined\enit@itemize@i
529 \patchcmd{\enit@itemize@i}
```

{\expandafter}

{\@typog@itemize@patch\expandafter}

```

A.9 Align Last Line of a Paragraph

The code of environment lastlineraggedleftpar has been inspired by macro \lastlineraggedleft [35, Sec. 2].

```
lastlineraggedleftpar (env.)
```

```
626 \NewDocumentEnvironment{lastlineraggedleftpar}{}
627      {\lastlinefit=0%
628      \setlength{\leftskip}{\z@ \@plus 1fil}%
629      \setlength{\rightskip}{-\leftskip}%
630      \setlength{\parfillskip}{\leftskip}}
631      {\par}
```

lastlineflushrightpar (env.) Define lastlineflushrightpar as an alias of lastlineraggedleftpar.

```
632 \let\lastlineflushrightpar=\lastlineraggedleftpar
633 \let\endlastlineflushrightpar=\endlastlineraggedleftpar
634
```

lastlinecenteredpar (env.) The code of environment lastlinecenteredpar has been inspired by Tex By Topic [11, Sec. 18.3.1].

```
635 \NewDocumentEnvironment{lastlinecenteredpar}{}
636     {\lastlinefit=0%
637     \setlength{\leftskip}{\z@ \@plus .5fil}%
638     \setlength{\rightskip}{-\leftskip}%
639     \setlength{\parfillskip}{\z@ \@plus 1fil}}
640     {\par}
```

A.10 Fill Last Line of a Paragraph

```
shortenpar (env.)
```

prolongpar (env.) We try to be prudent and inhibit hyphenation of the next-to-last line just in case the longer paragraph could be cheaply achieved by hyphenation – at the worst – of the last word.

```

Implementation Note

• The \tolerance values are calculated as the geometric mean of the extreme values 200 and 9999. This means the factor

$$f = \left(\frac{9999}{200}\right)^{1/8} \approx 1.63$$

defines additional tolerances which we generously round values in the

actual implementation.

- The \emergencystretch is scaled linearly with \(sloppiness \) and the ratio of the actual \linewidth to the (maximum) \textwidth.
- The \hfuzz values are interpolated linearly with \(sloppiness \) between .1pt and .5pt.

Maxima code to calculate the intermediate values.

```
Initialize. load("list_functions")$
      \tolerance: logspace(log10(200), log10(9999), 9), numer;
      \emergencystretch: linspace(0, 3, 9), numer;
       \hfuzz: linspace(.1, .5, 9);

\setbaselineskip Set the \baselineskip to an absolute length.

Implementation Note

Viewed as a standalone macro \setbaselineskip does not need the decoration \AfterPreamble. However, all of its siblings, \setbaselineskippercentage, \setleading, and \setleadingpercentage then would behave differently as they are delayed to the end of the preamble, but \setbaselineskip immediately becomes effective. For example, the successive calls

```
\setbaselineskippercentage{140}
\setbaselineskip{12.5pt}
```

in the preamble would set the baselineskip to 140% in the document. Therefore, \setbaselineskip is delayed too and the order of the calls thus preserved.

```
1240 \cs_new:Npn \setbaselineskip #1
```

```
1241 {
                                   \AfterPreamble{\typog@setbaselineskip{#1}}

A.17 Smooth Ragged

\typog@repeat As we shall have to repeat the line specifications for our paragraphs so often we introduce the two argument macro \typog@repeat that takes a $\langle repeat\text{-}count \rangle$ and a $\langle body \rangle$ that is repeated.

```
1316 \ExplSyntaxOn
1317 \cs_new_eq:NN \typog@repeat \prg_replicate:nn
1318
```

\typog@mod For error checking we shall need the modulo operation on integers, i. e., the remainder of an integral division.

```
\label{limit} $$1319 \end_{1}[2]_{\int_{0}^{1319} \end_{1}^{2}} $$1320 \end_{1}^{2}_{1}^{2}}$
```

\typog@triplet@max@lines Maximum number of lines a smoothraggedright paragraph can have with the triplet generator. The number must be divisible by 3.

```
1322 \newcommand*{\typog@triplet@max@lines}{99}
1323
```

B TYPOG-GREP 97

B typog-grep

The companion program **typog-grep** for analyzing the output of **typoginspect** and **typoginspectpar** has its own manual page. We reproduce it here for completeness of the documentation.

B.1 Name

typog-grep - specialized grep for typog-inspect elements in LATEX log files

B.2 Synopsis

```
typog-grep -a | --all | --any [OPTION...] LOG-FILE...
typog-grep [OPTION...] REGEXP LOG-FILE...
```

The first form, "discovery mode", shows all IDs of

```
<typog-inspect id="ID" ...>
```

elements in LOG-FILE.

The second form shows the contents, LOG-DATA, of the elements

```
<typog-inspect id="ID" ...>
LOG-DATA
</typog-inspect>
```

whose IDs match REGEXP in LOG-FILE.

If no LOG-FILE is given read from stdin. The filename - is synonymous to stdin.

B.3 Description

typog-grep is a tailored post-processor for LATEX log files and the typoginspect environment as provided by the LATEX package typog. It shares more with the venerable sgrep than with POSIX grep.

In the LAT_{EX} source file the user brackets her text or code in a typoginspect environment:

```
\begin{typoginspect}{ID}
TEXT-OR-CODE-TO-INVESTIGATE
\end{typoginspect}
```

where *ID* is used to identify one or more bracketed snippets. *ID* does not have to be unique. The *REGEXP* mechanism makes it easy to select groups of related *ID*s if they are named accordingly.

In *LOG-FILE* the result of the environment shows up, packed with tracing information, as

```
<typog-inspect id="ID" job="JOB-NAME" line="LINE-NUMBER" page="PAGE-NUMBER">
LOG-DATA
</typog-inspect>
```

where all the capital-letter sequences are meta-variables and in particular *JOB-NAME* is the expansion of \jobname, *LINE-NUMBER* is the LATEX source file line number of the beginning of the typoginspect environment, and *PAGE-NUMBER* is the page where the output of TEXT-OR-CODE-TO-INVESTIGATE occurs.

typog-grep reveals the contents of *LOG-FILE* between <typog-inspect id="*ID*" . . . > and </typog-inspect> excluding the XML-tags themselves. Access the *JOB-NAME*, *LINE-NUMBER*, and *PAGE-NUMBER* with the commandline options --job-name, --line-number, and --page-number, respectively. Use --id to show the name of the IDs that matched *REGEXP*.

typoginspect environments can be nested. **typog-grep** respects the nesting, i.e., if the *ID* of the nested environment does not match *REGEXP* it will not be included in the program's output.

B.4 Options

The list of options is sorted by the names of the long options.

```
-a, --all, --any
```

ID-discovery mode: Discover all typog-inspect elements independent of any matching patterns and print their *IDs*. The results are printed in their order of occurrence in the respective *LOG-FILEs*. Pipe the output into **sort** to get alphabetically ordered *IDs*.

Augment with options --job-name, --line-number, --log-line-number, or --page-number for more information.

```
--color, colour WHEN
```

Colorize specific log contents for the matching *IDs*. The argument *WHEN* determines when to apply color: always, never, or auto. The setting auto checks whether standard output has been redirected. This is the default.

-C, --config KEY=VALUE[:KEY=VALUE[:...]]

Set one or more configuration *KEY* to *VALUE* pairs. See section B.5 for a description of all available configuration items. Use option --show-config to display the default configuration.

--debug

Turn on debug output on stderr.

-E, --encoding ENCODING

Set the *ENCODING* of *LOG-FILE* for the translation to UTF-8. The default is unset.

Use this option to get rid of pesky "<*HEX-DIGITS*>" escapes on UTF-8 terminals. See option --**show-encodings** for the known encodings and Encode:: Supported for a summary of all encodings. See also section B.5.2.

Apply **iconv** (POSIX) or **recode** (GNU) on *LOG-FILE* before this tool to avoid having to use option **--encoding**.

-h, --help

Display brief help then exit.

-i, --[no-]id

Print the actual ID-name that matched *REGEXP*. Control the appearance of the matching *ID* with configuration item id-heading.

-y, --[no-]ignore-case

Match *IDs* while ignoring case distinctions in patterns and data.

-j, --[no-]job-name

Print the \jobname that latex associated with the input file.

-n, --[no-]line-number

Print the line number where the typoginspect environment was encountered in the LATEX source file.

-N, --[no-]log-line-number

Print the line number of the *log*-file where the current line was encountered.

-p, --[no-]page-number

Print page number where the contents of the typoginspect environment starts in the typeset document.

-P, --[no-]pager

Redirect output from stdout to the configured pager.

--show-config

Show the default configuration and exit.

--show-encodings

Show all known encodings and exit.

-V, --version

Show version information and exit.

-w, --[no-]word-regexp

Match only whole words.

B.5 Configuration

id-format=FORMAT

Control the *FORMAT* for printing matching ids in inline-mode, where *FORMAT* is passed to Perl's printf. Default: %s:.

id-heading=0|1

Choose between printing the matching *ID*s with option --id: Inline (0) or heading before the matching data (1). Default: 0.

id-heading-format=FORMAT

Control the *FORMAT* for printing matching *IDs* in heading-mode, where *FORMAT* is passed to Perl's printf. Default: --> %s <--.

id-indent=INDENT

Indentation of nested typog-inspect tags. Only used in "discovery mode" (first form), i.e., if --all is active. Default: 8.

id-max-length=MAXIMUM-LENGTH

Set the maximum length of a matching *ID* for printing. It a matching *ID* exceeds this length it will be truncated and the last three characters (short of *MAXIMUM-LENGTH*) will be replaced by dots. Default: 40.

line-number-format=FORMAT

Control the *FORMAT* for printing TeX source line numbers, where *FORMAT* is passed to Perl's printf. Default: %5d.

log-line-number-format=FORMAT

Control the *FORMAT* for printing log line numbers, where *FORMAT* is passed to Perl's printf. Default: %6d.

page-number-format=FORMAT

Control the *FORMAT* for printing page numbers, where *FORMAT* is passed to Perl's printf. Default: [%3d].

pager=PAGER

Name of pager application to pipe output into if run with option --pager. Default: less.

pager-flags=FLAGS

Pass FLAGS to PAGER. Default: --quit-if-one-screen.

Color Configuration

For the syntax of the color specifications consult the manual page of Term:: ANSIColor(pm).

file-header-color

Color of the filename header.

fill-state-color

Color of the messages that report "Underfull hbox" or "Overfull hbox".

first-vbox-color

Color of the first vbox on a page.

font-spec-color

Color of font specifications.

horizontal-break-candidate-color

Color of lines with horizontal-breakpoint candidates @.

horizontal-breakpoint-color

Color of lines with horizontal breakpoints @@.

id-color

Color of matching IDs when printed inline.

id-heading-color

Color of matching IDs when printed in heading form.

line-break-pass-color

Color of the lines showing which pass (e.g., @firstpass) of the line-breaking algorithm is active.

line-number-color

Color of TeX-source-file line numbers.

log-line-number-color

Color of log-file line numbers.

math-color

Color used for math expressions including their font specs.

page-number-color

Color of page numbers of the final output.

tightness-color

Color of lines with Tight/Loose hbox reports.

vertical-breakpoint-color

Color of possible vertical breakpoints.

B.5.1 Brief summary of colors and attributes

```
Foreground Color
```

black, red, green, yellow, blue, magenta, cyan, white, Prefix with bright_ for high-intensity or bold foreground.

Foreground Grey

Background Color

on_black, on_red, on_green, on_yellow, on_blue, on_magenta, on_cyan, on_white

Replace on_with on_bright_ for high-intensity or bold background.

Background Grey

Text Attribute

bold, dark, italic, underline, reverse

B.5.2 Some common encodings

The following list shows some encodings that are suitable for option --encoding.

Latin-1, Western European

Latin-2, Central European

Latin-3, South European (Esperanto, Maltese)

Latin-4, North European (Baltics)

Cyrillics

iso-8859-5, cp855, cp866 (Ukrainian), cp1251

Arabic

iso-8859-6, cp864, cp1006 (Farsi), cp1256

Greek

Hebrew

```
Turkish
    iso-8859-9, cp857, cp1254

Nordic
    iso-8859-10, cp865, cp861 (Icelandic)

Thai
    iso-8859-11, cp874

Baltic
    iso-8859-13, cp775, cp1257

Celtic
    iso-8859-14

Latin-9 (sometimes called Latin0)
    iso-8859-15

Latin-10
    iso-8859-16
```

B.6 Exit status

The exit status is 0 if at least one *ID* matched *REGEXP*, 1 if no *ID* matched *REGEXP*, and 2 if an error occurred.

B.7 Caveats

The end tag </typog-inspect> sometimes gets placed too early in the output and the trace *seems* truncated. However, LATEX reliably logs the requested the trace information, but the write operations for trace data and the code which is used to print the end tag are not synchronized.
